Graph Approach

The Covering Problem

The Covering Problem

Given:

- a compact set $\mathcal{T}\subset\mathbb{R}^3$,
- a finite set $R \subset \mathbb{R}_+$ of radii,
- a set N indexing the spheres and
- a function $\rho: \mathbb{N} \to \mathbb{R}$,

we have to find a set of spheres

$$\{ B(x(i),\rho(i)) \mid i \in N \}$$

of minimum cardinality and covering all the points in \mathcal{T} .

The Covering Problem A Formulation

In Liberti et al. 1 , the authors formulated the problem as follows:

$$\begin{aligned} ||x^{i} - p||^{2} &\leq u_{i}(p) \sum_{j \in U} w_{ij}r_{j}^{2} + (1 - u_{i}(p))M^{2}, \forall i \in N, \forall p \in T \\ &\sum_{j \in U} w_{ij} = 1, \quad \forall i \in N \\ &\sum_{i \in N} u_{i}(p) \geq 1, \quad \forall p \in T \\ &\int_{p \in T} u_{i}(p)dp \geq \epsilon y_{i}, \quad \forall i \in N \\ &\int_{p \in T} u_{i}(p)dp \leq \operatorname{Vol}(T) y_{i}, \quad \forall i \in N \end{aligned}$$

¹L. Liberti, N. Maculan & Y. Zhang. "Optimal configuration of gamma ray machine radiosurgery units: the sphere covering subproblem".

The Covering Problem A Formulation

Nonlinear nonconvex mixed-integer infinite programming problem:

$$\begin{aligned} ||x^{i} - p||^{2} &\leq u_{i}(p) \sum_{j \in U} w_{ij}r_{j}^{2} + (1 - u_{i}(p))M^{2}, \forall i \in N, \forall p \in T \\ &\sum_{j \in U} w_{ij} = 1, \quad \forall i \in N \\ &\sum_{i \in N} u_{i}(p) \geq 1, \quad \forall p \in T \\ &\int_{p \in T} u_{i}(p)dp \geq \epsilon y_{i}, \quad \forall i \in N \\ &\int_{p \in T} u_{i}(p)dp \leq \operatorname{Vol}(T) y_{i}, \quad \forall i \in N \end{aligned}$$

(日)

The Packing Problem

Characteristics of the packing problem:

- Overlappings are not allowed; and
- the spheres must be totally inside the container.

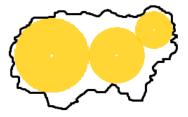

Figure : Example of a packing.

The Packing Problem

The goal is to maximize the density:

density =
$$\frac{\sum_{i} \text{volume}(\text{object}_{i})}{\text{volume}(\text{container})}$$
.

Objective function:

$$\max \ \frac{\sum_i \frac{4}{3}\pi \ r_i^3 \ y_i}{\text{volume}(\text{container})}.$$

Removing the constants:

$$max \sum_{i \in S} r_i^3 y_i.$$

э

A Formulation

For the problem of packing unequal spheres in a 3-dimensional polytope defined by

$$a_m x + b_m y + c_m z \ge d_m, \quad m = 1, \dots, M,$$

A. Sutou and Y. Dai¹ used the following variables in their model:

- (a) $x^i \in \mathbb{R}^3$ is the center of sphere *i*; and
- (b) $w_{ik} \in \{0, 1\}$ is set to 1, if sphere *i* has radius r_k .

¹A. Sutou & Y. Dai. "Global Optimization Approach to Unequal Sphere COPPE Packing Problems in 3D". *Journal of Optimization Theory and Application* Vol. 114, No 3, pp. 671-694, 2002. ▲口 → ▲圖 → ▲ 臣 → ▲ 臣 → □ 臣 □

The Covering Problem The Packing Problem Proposed Model Heuristic Discretization Graph Approach

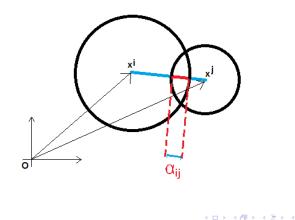

The Packing Problem A Formulation

In Sutou et al., the authors formulated the problem of packing unequal spheres in a 3-dimensional polytope as follows:

$$\begin{aligned} \max \quad & \frac{4}{3}\pi \sum_{i=1}^{K} \sum_{k=1}^{K} r_k^3 w_{ik} \\ \text{s.a} \quad ||x^i - x^j||^2 \geq \left(\sum_{k=1}^{K} r_k w_{ik} + \sum_{k=1}^{K} r_k w_{jk} \right)^2, \quad \forall i \neq j \\ |a_m x_i + b_m y_i + c_m z_i - d_m| / \sqrt{a_m^2 + b_m^2 + c_m^2} \geq \sum_{k=1}^{K} r_k w_{ik}, \quad \forall i, m \\ & a_m x_i + b_m y_i + c_m z_i - d_m \geq 0, \quad \forall i, \forall m \\ & \sum_{k=1}^{K} w_{ik} \leq 1, \quad \forall i \\ & w_{ik} \in \{0, 1\}, \quad \forall i, \forall k \end{aligned}$$

UFRJ

We propose a model based essentially on the parameters α , which represent the maximum allowed overlap between each pair of spheres.

So the constraints

$$||x^{i} - x^{j}||^{2} \ge (r_{i} + r_{j})^{2}$$

by introducing parameters $\boldsymbol{\alpha}$ become

$$||x^{i} - x^{j}||^{2} \ge (r_{i} + r_{j} - \alpha_{ij})^{2}.$$

But they should only constrain variables associated with spheres used in the packing.

Let $y_i \in \{0, 1\}$ assume value 1 if sphere *i* is packed.

We could have

$$||x^{i} - x^{j}||^{2} \ge (r_{i} + r_{j} - \alpha_{ij})^{2} y_{i} y_{j}$$

æ

Let $y_i \in \{0, 1\}$ assume value 1 if sphere *i* is packed.

We could have

$$||x^{i} - x^{j}||^{2} \ge (r_{i} + r_{j} - \alpha_{ij})^{2} y_{i} y_{j}.$$

But to avoid the multiplication of variables, we will use

$$||x^{i} - x^{j}||^{2} \ge (r_{i} + r_{j} - \alpha_{ij})^{2} (y_{i} + y_{j} - 1).$$

э

The Covering Problem Proposed Model

Proposed Model for the Covering Problem

$$\begin{array}{rl} \max & \sum_{i=1}^n c_i y_i \\ ||x^i - x^j||^2 & \geq & (r_i + r_j - \alpha_{ij})^2 \left(y_i + y_j - 1\right), \quad \forall \ 1 \leq i < j \leq n \\ & x^i \in \mathcal{T}, \quad \forall i \\ & \mathbf{y} \in \{0, 1\}^n \end{array}$$

The Covering Problem Proposed Model

Proposed Model for the Covering Problem

$$\begin{array}{rl} \max & \sum_{i=1}^{n} \boldsymbol{c}_{i} \, y_{i} \\ ||x^{i} - x^{j}||^{2} & \geq & (r_{i} + r_{j} - \boldsymbol{\alpha}_{ij})^{2} \left(y_{i} + y_{j} - 1\right), \quad \forall \, 1 \leq i < j \leq n \\ & x^{i} \in \mathcal{T}, \quad \forall i \\ & \mathbf{y} \in \{0, 1\}^{n} \end{array}$$

Heuristic

Heuristic

Hypothesis

Spheres of larger radius are more interesting in the solution.

Heuristic based on solving the following problem:

$$||x^i - x^j||^2 \ge (r_i + r_j - \alpha_{ij})^2, \quad \forall \ 1 \le i < j \le n$$

 $x^i \in T, \quad \forall i$

It considers a fixed set of spheres.

Idea:

- Start with a single sphere or only a few of them, all of the larger radius;
- If the solver returned a solution for this problem, use it as an initial solution for the next one, which has one more sphere available. For this sphere, its initial position will be generated randomically;
- If the solver claims the problem is infeasible, reduce the last added sphere's radius.

Let x be a real variable assuming values in the interval [a, b]:

$$a \le x \le b$$
 .

Discretization:

$$x = w_1 \lambda_1 + \cdots + w_L \lambda_L ,$$

where

- L is the quantity of points used in the discretization of the interval [a, b];
- $a < w_1 < \cdots < w_l < b$;
- $\lambda_i \in \{0, 1\}, \quad \forall i \in \{1, ..., L\}$; e
- $\sum_{i=1}^{L} \lambda_i = 1$.

In our model, we can apply this technique to the variables which represent the center of the spheres:

$$a_k^i \leq x_k^i \leq b_k^i$$
 .

Using the discretization we have just explained, we have:

$$x_k^i = w_{k,1}^i \lambda_{k,1}^i + \dots + w_{k,L_k^i}^i \lambda_{k,L_k^i}^i$$

where

$$\begin{split} &\sum_{i=1}^{L_k^i} \lambda_i = 1 \\ &\lambda_i \in \{0,1\}, \quad \forall i \in \{1,\dots,L_k^i\} \end{split}$$

It will be used in the calculation of the term $||x^{i} - x^{j}||^{2}$, present in the constraints of the model:

$$||x^{i} - x^{j}||^{2} = \sum_{k=1}^{3} (x_{k}^{i} - x_{k}^{j})^{2} = (x_{k}^{i})^{2} + 2x_{k}^{i}x_{k}^{j} + (x_{k}^{j})^{2}$$

æ

It will be used in the calculation of the term $||x^{i} - x^{j}||^{2}$, present in the constraints of the model:

$$||x^{i} - x^{j}||^{2} = \sum_{k=1}^{3} (x_{k}^{i} - x_{k}^{j})^{2} = (x_{k}^{i})^{2} + 2x_{k}^{i}x_{k}^{j} + (x_{k}^{j})^{2}$$

æ

It will be used in the calculation of the term $||x^{i} - x^{j}||^{2}$, present in the constraints of the model:

$$||x^{i} - x^{j}||^{2} = \sum_{k=1}^{3} (x_{k}^{i} - x_{k}^{j})^{2} = (x_{k}^{i})^{2} + 2 x_{k}^{i} x_{k}^{j} + (x_{k}^{j})^{2}$$

The term in focus is rewritten as:

$$(x_k^i)^2 = (w_{k,1}^i)^2 \lambda_{k,1}^i + \dots + (w_{k,L_k^i}^i)^2 \lambda_{k,L_k^i}^i$$

It will be used in the calculation of the term $||x^{i} - x^{j}||^{2}$, present in the constraints of the model:

$$||x^{i} - x^{j}||^{2} = \sum_{k=1}^{3} (x_{k}^{i} - x_{k}^{j})^{2} = (x_{k}^{i})^{2} + 2 x_{k}^{i} x_{k}^{j} + (x_{k}^{j})^{2}$$

The term in focus is rewritten as:

$$(x_k^i)^2 = (w_{k,1}^i)^2 \lambda_{k,1}^i + \dots + (w_{k,L_k^i}^i)^2 \lambda_{k,L_k^i}^i$$

It will be used in the calculation of the term $||x^{i} - x^{j}||^{2}$, present in the constraints of the model:

$$||x^{i} - x^{j}||^{2} = \sum_{k=1}^{3} (x_{k}^{i} - x_{k}^{j})^{2} = (x_{k}^{i})^{2} + 2 \frac{x_{k}^{i} x_{k}^{j}}{x_{k}^{j}} + (x_{k}^{j})^{2}$$

The term in focus is rewritten as:

$$(x_k^i)^2 = (w_{k,1}^i)^2 \lambda_{k,1}^i + \dots + (w_{k,L_k^i}^i)^2 \lambda_{k,L_k^i}^i$$

$$x_{k}^{i}x_{k}^{j} = \sum_{p=1}^{L_{k}^{i}}\sum_{q=1}^{L_{k}^{j}} w_{k,p}^{i}w_{k,q}^{i}\lambda_{k,p}^{i}\lambda_{k,q}^{i}$$

It will be used in the calculation of the term $||x^{i} - x^{j}||^{2}$, present in the constraints of the model:

$$||x^{i} - x^{j}||^{2} = \sum_{k=1}^{3} (x_{k}^{i} - x_{k}^{j})^{2} = (x_{k}^{i})^{2} + 2 \frac{x_{k}^{i} x_{k}^{j}}{x_{k}^{j}} + (x_{k}^{j})^{2}$$

The term in focus is rewritten as:

$$(x_k^i)^2 = (w_{k,1}^i)^2 \lambda_{k,1}^i + \dots + (w_{k,L_k^i}^i)^2 \lambda_{k,L_k^i}^i$$

$$x_{k}^{i}x_{k}^{j} = \sum_{p=1}^{L_{k}^{i}}\sum_{q=1}^{L_{k}^{j}} w_{k,p}^{i}w_{k,q}^{i}\lambda_{k,p}^{i}\lambda_{k,q}^{j}$$

We can linearize the term $\lambda_{k,p}^i \lambda_{k,q}^i$ replacing it with the variables

$$\mathsf{z}_{k,p,q}^{i,j} = \lambda_{k,p}^i \lambda_{k,q}^i$$

and adding the following constraints to the model:

$$\begin{array}{ll} z_{k,p,q}^{i,j} &\leq \lambda_{k,p}^{i} \\ z_{k,p,q}^{i,j} &\leq \lambda_{k,q}^{i} \\ z_{k,p,q}^{i,j} &\geq \lambda_{k,p}^{i} + \lambda_{k,q}^{i} - 1 \\ z_{k,p,q}^{i,j} &\geq 0 \end{array}$$
