# On the scattering by a cavity in an impedance plane in 3D: boundary integral equations and novel Green's function 

J.M.L. Bernard ${ }^{1}$<br>CEA-DIF, DAM, 91297 Arpajon, and, LRC MESO, CMLA, ENS Cachan, 61 av. du Prés. Wilson, 94235, France

summary :
The problem of the field scattered by a cavity embedded in an impedance (or Robin) plane is considered for the 3D Helmholtz equation in acoustics. Its resolution is more complex than for a scatterer above the plane, in particular because the Green's function for the unperturbed plane has a singular part unsuitable for applications below the plane. It is why the free space Green's function is commonly used in boundary integral equations for the cavity, and three unknowns are necessary. We propose here to use a novel Green's function below the impedance plane, which has the advantage to reduce the number of unknowns, and to simplify the problem. This specific Green's function derives from our recent study for passive and active unperturbed impedance planes. The uniqueness property is studied in passive case. The application to small cavity leads us to new analytical results.

## 1) Introduction

This paper presents novel integral equations for the field scattered by a cavity embedded in an imperflectly reflective plane with impedance boundary conditions, for the threedimensional Helmholtz equation.
The development of boundary integral equation methods, in 2D and 3D, for this scattering problem is rather recent [1], [2], seemingly because of specific difficulties due to the representation of the field in the cavity. Indeed, the Green's function $G_{a}$, defined as the field of a monopole in presence of the unperturbed impedance plane, that is well adapted for solving the case of a perturbation in relief, has a logarithmic singularity in lower half space, which prevents it from being applied below the plane. It is why another representation is necessary in the cavity, and, until now, the Green's function in free space was used, which implies three distinct integral equations for three surface field unknowns [1] : the field and its normal derivative on the aperture of the cavity, and the field on the surface of the cavity.

[^0]To reduce the number of unknowns and simplify the system of integral equations, we here develop an original way, consisting in the definition of a new Green's function that we name the 'below' Green's function $G_{b}$. Both functions $G_{a}$ and $G_{b}$ satisfy the impedance condition on the unperturbed surface, but the scattered fields attached to them are respectively regular above and below the plane. They derive from the solution for an arbitrary constant impedance plane (passive or active) given in [3]-[4].
Morever, our system of two novel integral equations has the property of uniqueness of the solution. It is an important point, particularly if we notice that most of the boundary integral equation methods in the related problem of electromagnetism, which use the generalized network formulation [5], are not uniquely solvable at some discrete frequencies [6]. Otherwise, other methods verify uniqueness, in particular the one developed by Chandler-Wilde in acoustics, with a system of three integral equations [1], and the one used by Xu for perfectly conducting surface in electromagnetism, with a system of two vectorial integral equations [6]. It is worth noticing that, in [6], the generalized network formulation is corrected by the image theory, which is equivalent to using a specific Green's function in the cavity that takes account of the plane.
This scattering problem can be also analyzed in complex spectral domain in 2D, or by asymptotic methods in 2D and 3D. So, integral equations with smooth kernels, which permit various approximations for large or small polygonal cavity in 2D [7], or asymptotic expressions for a large cavity [8]-[9], have been developed.

The paper is organized as follows. In section 2, we define the properties of the acoustic field, and analyze the uniqueness of the boundary value problem. We present in section 3, the expressions of the Green's functions $G_{a}$ and $G_{b}$, derived from the solution for an unperturbed impedance plane. In section 4, we use the second Green's theorem and give a representation of the field above the plane and in the cavity. We then deduce the system of integral equations in section 5 and show the property of uniqueness in section 6 . In section 7 , this new system is considered for small cavity and original analytical results are derived.

## 2) Formulation of the boundary value problem and uniqueness

## 2.1) Boundary value problem

We consider the pressure field $p_{s}$ scattered by an imperfectly reflective plane that is perturbed by a cavity (figure 1 ), when it is illuminated by the incident pressure field $p_{i n c}$,
radiated by a bounded source $W$ above the plane, and satisfying the Helmholtz equation,

$$
\begin{equation*}
\left(\Delta+k^{2}\right) p_{i n c}=W \tag{1}
\end{equation*}
$$

in $R^{3}$, with $|\arg (i k)| \leq \pi / 2$.
The plane $S_{0}$ is defined by $z=0$ in Cartesian coordinates $(x, y, z)$. The domain of the cavity with $z<0$, and the half-space above the plane with $z \geq 0$, are respectively denoted $\Omega_{2}$ and $\Omega_{1}$. The aperture and the surface of the cavity, respectively denoted $S_{1}$ and $S_{2}$, are assumed to be piecewise analytic (with no zero exterior angles, i.e. no points of $\Omega_{2}$ inside a cusp), bounded by a Jordan curve $C_{1}$.

figure 1 : geometry and definition of the cavity

For any plane wave of incidence angle $\beta$ composing $p_{i n c}$, the infinite plane, when it is unperturbed, has a reflection coefficient $R(\beta)$ given by,

$$
\begin{equation*}
R(\beta)=\frac{\cos \beta-g}{\cos \beta+g} \tag{2}
\end{equation*}
$$

so that $p=p_{s}+p_{\text {inc }}$ verifies the impedance (or Robin) boundary condition,

$$
\begin{equation*}
\left(\frac{\partial}{\partial z}-i k g\right) p=0 \tag{3}
\end{equation*}
$$

on the plane $S_{0}$, except on the aperture $S_{1}$ of the cavity. The term $g=\sin \theta_{1}$ is denoted the impedance parameter. In (3), it is a constant, with $\operatorname{Re}\left(i k \cos \theta_{1}\right) \neq 0$ when $\operatorname{Re} \theta_{1} \leq 0$. This condition on $g$ is due to the presence of a cut in the solution for an unperturbed plane [3]-[4], along the path $\operatorname{Re}\left(i k \cos \theta_{1}\right)=0$ as $\operatorname{Re} \theta_{1} \leq 0$. Therefore, the surface waves, which radiate without exponential decay at infinity, can only be considered in the sense of the limit for $\operatorname{Re}\left(i k \cos \theta_{1}\right)=0^{+}$or $0^{-}$when $\operatorname{Re} \theta_{1} \leq 0$.

Some general properties are considered for the scattered field in $\Omega_{1}$ and $\Omega_{2}$ :
(a) $p_{s}(z)$, which satisfies the Helmholtz equation

$$
\begin{equation*}
\left(\Delta+k^{2}\right) p_{s}=0 \text { with }|\arg (i k)| \leq \pi / 2 \tag{4}
\end{equation*}
$$

is regular in $\Omega_{1} \cup \Omega_{2}$, except at edges and corners of $S_{2}$ where

$$
\begin{equation*}
p_{s}=O(1) \text { and } \operatorname{grad}\left(p_{s}\right)=O\left(|r|^{\alpha}\right),-1<\alpha \leq 0 \tag{5}
\end{equation*}
$$

as the distance $|r|$ to the edge or corner vanishes [8], and $p_{s}$ is continuous on the scatterer;
(b) $p_{s}$ is constituted of outgoing waves, with guiding waves exponentially vanishing at infinity $\left(\operatorname{Re}\left(i k \cos \theta_{1}\right) \neq 0\right.$ as $\left.\operatorname{Re} \theta_{1} \leq 0\right)$, and, the field at $M$, with $r=\overline{O M}$, verifies,

$$
\begin{equation*}
p_{s}=O\left(e^{-\delta|r|}\right) \tag{6}
\end{equation*}
$$

$\delta>0$, as $z$ or $\rho=\sqrt{x^{2}+y^{2}} \rightarrow \infty, z>0$, when $|\arg (i k)|<\pi / 2$, and

$$
\begin{equation*}
\frac{\partial p_{s}}{\partial|r|}+i k p_{s}=o\left(|r|^{-1}\right), p_{s}=O\left(|r|^{-1}\right) \tag{7}
\end{equation*}
$$

as $|r|=\sqrt{x^{2}+y^{2}+z^{2}} \rightarrow \infty, z \geq 0$, when $|\arg (i k)|=\pi / 2$.

In addition, an impedance boundary condition is assumed on the surface of the cavity,

$$
\begin{equation*}
\left.\left(\frac{\partial}{\partial n}-i k g_{c}\right) p\right|_{S_{2}}=0 \tag{8}
\end{equation*}
$$

where $\widehat{n}$ is the normal to $S_{2}$ directed inside $\Omega_{2}, g_{c}$ is a function piecewise analytic on $S_{2}$.

## Remark 1 :

Let us notice that the definitions of the 'acoustic impedance' ( $\equiv A_{0} p / \frac{\partial p}{\partial n}, A_{0}$ a constant) generally used in physics [20], and of our 'impedance parameter' ( $\equiv \frac{\partial p}{\partial n} /(i k p)$ ), are different.

## 2.2) Uniqueness of the solution of the boundary value problem from [10, sect.7]

In [10], Levine develops an uniqueness theorem, i.e. a proof that $p_{\text {inc }} \equiv 0$ implies $p \equiv 0$, in the case of a scatterer with impedance boundary conditions. He considers piecewise $C^{(2+\lambda)}$ surface (with no zero exterior angle), $\lambda>0$, without auxiliary 'edge conditions' at edges or corner points, except that $p$ is continuous. He studies at first bounded scatterers, but he also gives, in section 7 of his paper, the elements to generalize his results to scatterers with infinite boundaries, in particular by the use of Jones' uniqueness theorem [11], that we follow.
We begin to notice first that the conditions given by Levine to apply the Green's first theorem are satisfied : the cavity is piecewise analytic (with no zero exterior angle), the
field is countinuous on the scatterer, it satisfies impedance boundary conditions and the conditions (b) at infinity. So, we can write,

$$
\begin{align*}
& \int_{\Omega}\left(p^{*}(r) \Delta p(r)+\operatorname{grad} p^{*}(r) \operatorname{grad} p(r)\right) d V=-\int_{S} p^{*}(r)(\widehat{n} \operatorname{grad} p) d S+ \\
& +\lim _{a \rightarrow \infty} \int_{r=a, z \geq 0} p^{*}(r)\left(\frac{\partial p(r)}{\partial r}\right) d S \tag{9}
\end{align*}
$$

where $\Omega \equiv \Omega_{1} \cup \Omega_{2}, S \equiv S_{2} \cup\left(S_{0} \backslash S_{1}\right), \widehat{n}$ is the inward normal to $\Omega$, and from (3)-(8),

$$
\begin{align*}
& \operatorname{Re}\left(\int_{\Omega}-i k|p(r)|^{2}+\frac{|\operatorname{grad} p(r)|^{2}}{-i k} d V\right)=\int_{S_{2}} \operatorname{Re}\left(g_{c}\right)|p(r)|^{2} d S+ \\
& +\int_{S_{0} \backslash S_{1}} \operatorname{Re}(g)|p(r)|^{2} d S+I_{\infty}, \tag{10}
\end{align*}
$$

where

$$
\begin{align*}
& I_{\infty}=\operatorname{Re} \lim _{a \rightarrow \infty} O\left(e^{-\delta a}\right)=0 \text { for }|\arg (i k)|<\pi / 2 \\
& I_{\infty}=\lim _{a \rightarrow \infty} \int_{r=a, z \geq 0}|p(r)|^{2} d S>0 \text { for }|\arg (i k)|=\pi / 2 \tag{11}
\end{align*}
$$

For $\operatorname{Re}(g) \geq 0, \operatorname{Re}\left(g_{c}\right) \geq 0$ and $|\arg (i k)| \leq \pi / 2$, the left-hand term is negative since $\operatorname{Re}(i k) \geq 0$, while the right-hand term is positive, and thus both terms vanish. Consequently, we have, when $|\arg (i k)|<\pi / 2$,

$$
\begin{equation*}
p(r)=0 \text { in } \Omega, \text { for } \operatorname{Re}(g) \geq 0, \operatorname{Re}\left(g_{c}\right) \geq 0 \tag{12}
\end{equation*}
$$

and, when $|\arg (i k)|=\pi / 2$,

$$
\begin{align*}
& p(r)=0 \text { on } S, \text { for } \operatorname{Re}(g)>0, \operatorname{Re}\left(g_{c}\right)>0, \\
& \partial_{n} p(r)=0 \text { on } S, \text { for } \operatorname{Re}(g)>0, \operatorname{Re}\left(g_{c}\right)>0, \text { or } g=g_{c}=0 . \tag{13}
\end{align*}
$$

In the latter case, we can use, as suggested by Levine, the Jones' uniqueness theorem [11] for surfaces conical at infinity, when Neumann boundary condition ( $\left.\partial_{n} p(r)\right|_{S}=0$ ) is satisfied, which implies $u \equiv 0$ in the entire domain $\Omega$, and thus completes the proof of uniqueness. Let us notice, that another proof has been independently developed in [1] when $S$ is smooth.

## 3) The 'above' Green's function $G_{a}$ and the 'below' Green's function $G_{b}$

The integral representations of the field with single and double layers potentials generally derive from the use of free space Green's function [8], but more complex Green's
functions, verifying particular boundary conditions, can be used. In this latter case, a particular attention must be paid to the regularity of these functions.
So, when we consider a perturbation, due to a scatterer above an impedance plane, we can use the solution $G_{a}$ for a monopole above this plane to express the field everywhere, while it is generally not possible when we have a cavity, because of the logarithmic singularity of $G_{a}$ below the plane.
Therefore, we here develop an original way consisting in using another Green's function that we name the 'below' Green's function $G_{b}$. Both functions $G_{a}$ and $G_{b}$ derive from the solution for an unperturbed plane, respectively with the impedances $g$ and $-g$.
In this section, the solution for active and passive plane [3]-[4] are briefly presented, then $G_{a}$ and $G_{b}$ are developed.

## 3.1) The solution for an unperturbed impedance plane with arbitrary impedance

### 3.1.1) Solution for a monopole

The incident field radiated at $M(x, y, z)$ by a monopole at $r^{\prime}\left(x^{\prime}, y^{\prime}, z^{\prime}=h\right)$ (figure 2) is given by $p_{\text {inc }}=e^{-i k R(z)} / k R(z)$, with $R(z)=\sqrt{\left(x-x^{\prime}\right)^{2}+\left(y-y^{\prime}\right)^{2}+\left(z-z^{\prime}\right)^{2}}$.

figure 2 : geometry and definition of $\varphi$ for the radiation at $M$

From [3], the field $p_{s}$ scattered by the impedance plane is given by

$$
\begin{equation*}
p_{s}=\frac{e^{-i k R(-z)}}{k R(-z)}+2 i g e^{i k g(z+h)} \mathcal{J}_{g}(\rho,-z-h), \tag{14}
\end{equation*}
$$

where $R(-z)=\sqrt{\rho^{2}+(z+h)^{2}}, z+h=R(-z) \cos \varphi, \rho=R(-z) \sin \varphi$, and,

$$
\begin{equation*}
\mathcal{J}_{g}(\rho,-z)=\frac{e^{-i k g z}}{2} \int_{\mathcal{D}} \frac{H_{0}^{(2)}(k \rho \sin \beta) e^{-i k z \cos \beta}}{\cos \beta+g} \sin \beta d \beta \tag{15}
\end{equation*}
$$

for $z>0, g=\sin \theta_{1}$, with $\operatorname{Re}(i k \sin \beta)=0$ on $\mathcal{D}$ from $-i \infty-\arg (i k)$ to $i \infty+\arg (i k)$. This function is a Fourier-Bessel integral commonly encountered in scattering theory [12, p.234], also called a Sommerfeld-type integral [13], which has a cut described by $\operatorname{Re}\left(i k \cos \theta_{1}\right)=0$ when $\operatorname{Re}(g) \leq 0$ and a singularity at $g=-1$.
A correct definition of $\mathcal{J}_{g}$ for arbitrary $g=\sin \theta_{1}$, active $(\operatorname{Re} g<0)$ or passive $(\operatorname{Re} g>0)$, except on the cut, is also given [3] by,

$$
\begin{equation*}
\mathcal{J}_{g}(\rho,-z-h)=-\int_{-i b}^{\infty} e^{-a \operatorname{cosht}} d t=i \int_{b}^{i \infty} e^{-a \cos \alpha} d \alpha \tag{16}
\end{equation*}
$$

where $a=\epsilon i k R(-z) \sin \varphi \cos \theta_{1}, \epsilon=\operatorname{sign}\left(\operatorname{Re}\left(i k \cos \theta_{1}\right)\right)\left(\operatorname{Re}(a)=0\right.$ is on a cut of $\mathcal{J}_{g}$ and it can be only considered in the sense of the limit), and $b$ satisfies

$$
\begin{equation*}
e^{\mp i b}=\frac{i k R(-z)}{a}\left(1 \pm \sin \theta_{1}\right)(1 \pm \cos \varphi) \tag{17}
\end{equation*}
$$

with $|\operatorname{Re} b|<\pi, e^{-2 i b}=\frac{\left(1+\sin \theta_{1}\right)(1+\cos \varphi)}{\left(1-\sin \theta_{1}\right)(1-\cos \varphi)},\left|\operatorname{Re}\left(\theta_{1}\right)\right| \leq \pi / 2$. As $g$ varies, this expression has a correct cut as $\epsilon$ changes of sign for $\operatorname{Re} g<0$, and is regular elsewhere (note: for $\operatorname{Re} g>0$, the change of sign of $\epsilon$ does not induce a cut as $g$ varies). The figure 3 shows the agreement of $\mathcal{J}_{g}$ given by (16) and by Fourier-Bessel expansion (15).

figure 3) Comparison of $\mathcal{J}_{g}$ given by (16) ( $-\square-$ ) and by Fourier-Bessel expansion when (15) is used ( $-\circ-$ ), when Reg varies; left : $\left|\mathcal{J}_{g}\right|$ when $\operatorname{Im}(g)=-0.4, z+h=.2, \rho=.3, i k=.01+i 1$.; right: $\left|\mathcal{J}_{g}\right|$ when $\operatorname{Im}(g)=1.2, z+h=1 ., \rho=1 ., i k=.01+i 1$.

### 3.1.2) Some properties of $\mathcal{J}_{g}$

Some general properties of $\mathcal{J}_{g}$, derived from (16), are worth noticing. Using the integral expression of the modified Bessel function $K_{0}$ [17], we can write,

$$
\begin{equation*}
\mathcal{J}_{g}(\rho,-z-h)+K_{0}(a)=-i \int_{0}^{b} e^{-a \cos \alpha} d \alpha=-i \int_{-b}^{0} e^{-a \cos \alpha} d \alpha \tag{18}
\end{equation*}
$$

which implies, by definition of $b$ and $a$, that

$$
\begin{equation*}
\mathcal{J}_{g}(\rho,-z-h)+K_{0}(a)=-\mathcal{J}_{-g}(\rho, z+h)-K_{0}(a) \tag{19}
\end{equation*}
$$

where $a=\epsilon i k \rho \cos \theta_{1}, \epsilon=\operatorname{sign}\left(\operatorname{Re}\left(i k \cos \theta_{1}\right)\right)$. From the regularity of $\mathcal{J}_{ \pm g}(\rho,-z)$ for $z>0$ and the expression of $b$, we deduce that $\mathcal{J}_{g}(\rho,-z)$ has a logarithmic singularities when $z \leq 0$ at $\rho=0$. So, when $a$, and thus, when $\rho$ vanishes, we have [3]

$$
\begin{align*}
\mathcal{J}_{g}(\rho,-z) & \sim-2 K_{0}(a) \text { when } z<0, g \neq-1, \\
\mathcal{J}_{g}(\rho,-z) & \sim-K_{0}(a) \text { when } z=0, g \neq-1 . \\
\mathcal{J}_{g}(\rho,-z) & \sim-E_{1}\left(\frac{i k(1+g)}{2}(|r|+z)\right) \tag{20}
\end{align*}
$$

Moreover, the reader can verify by inspection that,

$$
\begin{equation*}
\frac{\partial \mathcal{J}_{g}(\rho,-z-h)}{\partial z}=\frac{e^{-i k(R(-z)+g z)}}{R(-z)} \tag{21}
\end{equation*}
$$

and,

$$
\begin{equation*}
\left(\Delta+k^{2}\right)\left(e^{i k g z} \mathcal{J}_{g}(\rho,-z)\right)=4 \pi e^{i k g z} U(-z) \delta(x) \delta(y) \tag{22}
\end{equation*}
$$

where $U$ is the unit step function, $\delta$ is the Dirac function.

## Remark 2 :

Let us notice [3] that, for $\operatorname{Re} g>0$ and $\arg (i k)=\pi / 2$,

$$
\begin{equation*}
\mathcal{J}_{g}(\rho,-z-h)=\int_{-i \infty}^{0} e^{-i k g\left(z_{1}+z+h\right)} \frac{e^{-i k R\left(-z_{1}-z\right)}}{k R\left(-z_{1}-z\right)} k d z_{1} \tag{23}
\end{equation*}
$$

where $R(-z)=\sqrt{\rho^{2}+(z+h)^{2}}$, and that, for $g=1$,

$$
\begin{equation*}
\mathcal{J}_{g=1}(\rho,-z-h)=-E_{1}(i k(R(-z)+(z+h))) \tag{24}
\end{equation*}
$$

where $E_{1}$ is the exponential integral [17].

## 3.2) The functions $G_{a}$ and $G_{b}$

### 3.2.1) The Green's functions $G_{a}$ above the plane

The Green's function $G_{a}$ is given by the solution for a monopole above the plane with impedance parameter $g$. From the previous section, it is given by

$$
\begin{equation*}
G_{a}\left(r, r^{\prime}\right)=G^{0}\left(x-x^{\prime}, y-y^{\prime}, z-z^{\prime}\right)+G_{g}^{s}\left(x-x^{\prime}, y-y^{\prime},-z-z^{\prime}\right), \tag{25}
\end{equation*}
$$

where $G^{0}$ is the free space Green's function,

$$
\begin{equation*}
G^{0}(r)=\frac{e^{-i k|r|}}{k|r|} \tag{26}
\end{equation*}
$$

and $G_{g}^{s}$ is the scattered Green's function,

$$
\begin{equation*}
G_{g}^{s}(r)=\frac{e^{-i k|r|}}{k|r|}+2 i g e^{-i k g z} \mathcal{J}_{g}(\rho, z) \tag{27}
\end{equation*}
$$

with $|r|=\sqrt{\rho^{2}+z^{2}}$ and $\rho=\sqrt{x^{2}+y^{2}}$.
Because

$$
\begin{equation*}
\left(\Delta+k^{2}\right) G^{0}(r)=\frac{-4 \pi}{k} \delta(x) \delta(y) \delta(z) \tag{28}
\end{equation*}
$$

and the equation (22) satisfied by $\mathcal{J}_{g}(\rho,-z)$, the function $G_{a}$ verifies in $R^{3}$,

$$
\begin{align*}
& \left(\Delta+k^{2}\right) G_{a}\left(r, r^{\prime}\right)=\frac{-4 \pi}{k}\left(\delta\left(r-r^{\prime}\right)+\right. \\
& \left.+\delta\left(r-r_{i m}^{\prime}\right)-2 i k g e^{i k g\left(z+z^{\prime}\right)} U\left(-z-z^{\prime}\right) \delta\left(x-x^{\prime}\right) \delta\left(y-y^{\prime}\right)\right) \tag{29}
\end{align*}
$$

where $r_{i m}^{\prime} \equiv\left(x^{\prime}, y^{\prime},-z^{\prime}\right), \delta(r) \equiv \delta(x) \delta(y) \delta(z)$. It satisfies correct radiation conditions at infinity for $z \geq 0$ (condition (b)), and will be our choice for the Green's function above the plane for arbitrary $g=\sin \theta_{1}$, except for $\operatorname{Re}\left(i k \cos \theta_{1}\right)=0$ when $\operatorname{Re}(g) \leq 0$ (i.e. except on the cut of $\mathcal{J}_{g}$ ).

### 3.2.2) The Green's functions $G_{b}$ below the impedance plane

The function $G_{a}$ cannot be used to describe the field in the cavity, when it is influenced by fictitious sources on the aperture, in particular because of the presence of a logarithmic singularity of $\mathcal{J}_{g}(\rho,-z)$ for negative $z$ when $\rho=0$.

However, we can consider $\mathcal{J}_{-g}(\rho, z)$ instead of $\mathcal{J}_{g}(\rho,-z)$, and obtain an original Green's function $G_{b}$, which is suitable for an integral representation of the field in the cavity, and continues to satisfy the impedance boundary condition (3). This choice will be corrected in the vicinity of $g=1$ to take account of the singularity of $\mathcal{J}_{-g}$ at this point.

### 3.2.2.1) The function $G_{b}$ for $g \neq 1$

We remark that, below the plane where $z+z^{\prime}<0$, the function

$$
\begin{equation*}
G_{b}\left(r, r^{\prime}\right)=G^{0}\left(x-x^{\prime}, y-y^{\prime}, z-z^{\prime}\right)+G_{-g}^{s}\left(x-x^{\prime}, y-y^{\prime}, z+z^{\prime}\right) \tag{30}
\end{equation*}
$$

with

$$
\begin{equation*}
G_{-g}^{s}(r)=\frac{e^{-i k|r|}}{k|r|}-2 i g e^{i k g z} \mathcal{J}_{-g}(\rho, z) \tag{31}
\end{equation*}
$$

continues to satisfy the impedance boundary condition (3) on the plane $z=0$, is regular for $z+z^{\prime}<0$, except for the singularity of $G^{0}$ at $z=z^{\prime}$, and verifies in $R^{3}$,

$$
\begin{align*}
& \left(\Delta+k^{2}\right) G_{b}\left(r, r^{\prime}\right)=\frac{-4 \pi}{k}\left(\delta\left(r-r^{\prime}\right)+\right. \\
& \left.+\delta\left(r-r_{i m}^{\prime}\right)+2 i k g e^{i k g\left(z+z^{\prime}\right)} U\left(z+z^{\prime}\right) \delta\left(x-x^{\prime}\right) \delta\left(y-y^{\prime}\right)\right) \tag{32}
\end{align*}
$$

where $r_{i m}^{\prime} \equiv\left(x^{\prime}, y^{\prime},-z^{\prime}\right), \delta(r) \equiv \delta(x) \delta(y) \delta(z)$.
This will be our choice for the Green's function below the plane, except in the vicinity of $g=1$ (where $\mathcal{J}_{-g}$ is singular) and on the cut of $\mathcal{J}_{-g}$ (the case with $\operatorname{Re}\left(i k \cos \theta_{1}\right)=0$ has to be taken in the sense of the limit). Let us notice that it satisfies the usual radiation conditions at infinity, similar to (b) but in lower space instead of upper space.

## Remark 3 :

In the case of a cavity $\Omega_{2}$ filled with a material, we can consider the wave number $k_{2}$ instead of $k$, and $g_{2}=k g / k_{2}$ in place of $g$, so that $G_{b}$ continues to satisfies the impedance boundary condition (3) on the plane $z=0$.

### 3.2.2.2) A suitable choice for $G_{b}$ when $g \simeq 1$, regular on the cut of $\mathcal{J}_{-g}$

The function $\mathcal{J}_{-g}(\rho, z)$ is singular at $g=1$. However, considering the equations (19) and the domain of regularity of $\mathcal{J}_{g}$ [3], the function $\mathcal{J}_{-g}(\rho, z)+2 K_{0}(a)$ is regular for $\rho \neq 0$ in vicinity of $g=1$, as $g=\sin \theta_{1}$ varies, with $a=i k \epsilon \rho \cos \theta_{1}, \epsilon=\operatorname{sign}\left(\operatorname{Re}\left(i k \cos \theta_{1}\right)\right)$. We
can then use that

$$
\begin{equation*}
K_{0}(a)+\ln (a) I_{0}(a) \tag{33}
\end{equation*}
$$

is an entire function of $a$ [17], and

$$
\begin{equation*}
\left(\Delta+k^{2}\right)\left(e^{i k \sin \theta_{1} z} I_{0}\left(i k \epsilon \rho \cos \theta_{1}\right)=0\right. \tag{34}
\end{equation*}
$$

and choose to add the term

$$
\begin{equation*}
D_{b}\left(r, r^{\prime}\right)=4 i g \ln \left(i k d \cos \theta_{1}\right) I_{0}\left(i k \cos \theta_{1} \sqrt{\left(x-x^{\prime}\right)^{2}+\left(y-y^{\prime}\right)^{2}}\right) e^{i k g\left(z+z^{\prime}\right)} \tag{35}
\end{equation*}
$$

to $G_{b}$ for $g \simeq 1$, where $d$ is an arbitrary constant. So defined,

$$
\begin{equation*}
G_{b}\left(r, r^{\prime}\right)=G^{0}\left(x-x^{\prime}, y-y^{\prime}, z-z^{\prime}\right)+G_{-g}^{s}\left(x-x^{\prime}, y-y^{\prime}, z+z^{\prime}\right)+D_{b}\left(r, r^{\prime}\right), \tag{36}
\end{equation*}
$$

becomes regular for $\operatorname{Re} g \geq 0$, and presents, as $g$ varies, the same cut and singularities as $G_{a}$ for $\operatorname{Re} g \leq 0$.
This function continues to satisfy the impedance boundary condition (3) on the plane $z=0$, is regular for $z+z^{\prime}<0$ except for the singularity of $G^{0}$, and verifies (32). The corrective term $D_{b}\left(r, r^{\prime}\right)$ does not satisfy the usual radiation conditions at infinity but it will be of no consequence for our demonstration in further sections, and this function can be used when $\left|i k \epsilon \rho \cos \left(\theta_{1}\right)\right| \ll 1$ is verified in the whole cavity.

## Remark 4 :

For $g \rightarrow 1$, we notice [3] that

$$
\begin{align*}
& \mathcal{J}_{-g}(\rho, z)=E_{1}\left(\frac{i k(1+g)(|r|+z)}{2}\right)-2 K_{0}(a)+ \\
& +O\left(i k(1-g)(|r|-z) E_{2}\left(\frac{i k(1+g)(|r|+z)}{2}\right)\right) \tag{37}
\end{align*}
$$

and thus

$$
\begin{equation*}
G_{-g}^{s}(r)+D_{b}(r) \rightarrow \frac{e^{-i k|r|}}{k|r|}-2 i e^{i k z}\left(E_{1}(i k(|r|+z))+2 \ln (\rho / d)\right) \tag{38}
\end{equation*}
$$

which is regular for $\rho=0, z<0$, since, $|r|+z=\frac{\rho^{2}}{|r|-z}$ and $E_{1}(v)=-\ln (v)+O(1)$.

### 3.2.3) Some additional properties of $G_{a, b}\left(r, r^{\prime}\right)$

From the derivative of $\mathcal{J}_{g}$ given in (21), we have

$$
\begin{align*}
& \left(\frac{\partial .}{\partial z^{\prime}}-i k g\right) G_{a, b}\left(r, r^{\prime}\right) \\
& =\left(\frac{\partial .}{\partial z^{\prime}}\right)\left(G^{0}\left(r-r^{\prime}\right)+G^{0}\left(r-r_{i m}^{\prime}\right)\right)-i k g\left(G^{0}\left(r-r^{\prime}\right)-G^{0}\left(r-r_{i m}^{\prime}\right)\right) \tag{39}
\end{align*}
$$

where $r_{i m}^{\prime} \equiv\left(x^{\prime}, y^{\prime},-z^{\prime}\right)$. This leads us to write, when $z=0$,

$$
\begin{equation*}
\left.\left(\frac{\partial .}{\partial z^{\prime}}-i k g\right) G_{a, b}\left(r, r^{\prime}\right)\right|_{z=0}=\left.\left(\frac{\partial \cdot}{\partial z^{\prime}}\right)\left(2 G^{0}\left(r-r^{\prime}\right)\right)\right|_{z=0} \tag{40}
\end{equation*}
$$

and, when $z^{\prime} \rightarrow 0, z \neq 0$,

$$
\begin{equation*}
\left(\frac{\partial .}{\partial z^{\prime}}-i k g\right) G_{a, b}\left(r, r^{\prime}\right) \rightarrow 0 \tag{41}
\end{equation*}
$$

These properties will be particularly useful to prove the continuity of the normal derivative of the field, deduced from our solution, through the aperture of the cavity.
Moreover, for our choice of $G_{b}$ in section 3.2.2.1 (for $g \neq 1$ ), we have

$$
\begin{align*}
& G_{b}\left(r, r^{\prime}\right)=G_{a}\left(r, r^{\prime}\right)+4 i g e^{i k g\left(z+z^{\prime}\right)} K_{0}(a) \\
& \left.G_{b}\left(r, r^{\prime}\right)\right|_{g=v}=\left.G_{a}\left(r_{i m}, r_{i m}^{\prime}\right)\right|_{g=-v} \\
& \left.\left(G_{a}\left(r, r^{\prime}\right)+G_{b}\left(r, r^{\prime}\right)\right)\right|_{z=z^{\prime}=0}=4\left(\frac{e^{-i k \rho}}{k \rho}+i g\left(\mathcal{J}_{g}(\rho, 0)+K_{0}(a)\right)\right) \tag{42}
\end{align*}
$$

while, for our choice of $G_{b}$ in section 3.2.2.2 (for $g \simeq 1$ ),

$$
\begin{align*}
& G_{b}\left(r, r^{\prime}\right)=G_{a}\left(r, r^{\prime}\right)+4 i g e^{i k g\left(z+z^{\prime}\right)}\left(K_{0}(a)+\ln \left(i k d \cos \left(\theta_{1}\right)\right) I_{0}\left(i k \rho \cos \left(\theta_{1}\right)\right)\right) \\
& \left.\left(G_{a}\left(r, r^{\prime}\right)+G_{b}\left(r, r^{\prime}\right)\right)\right|_{z=z^{\prime}=0}=4\left(\frac{e^{-i k \rho}}{k \rho}+i g\left(\mathcal{J}_{g}(\rho, 0)+K_{0}(a)+\right.\right. \\
& \left.\left.+\ln \left(i k d \cos \left(\theta_{1}\right)\right) I_{0}\left(i k \rho \cos \left(\theta_{1}\right)\right)\right)\right) \tag{43}
\end{align*}
$$

where

$$
\begin{equation*}
\mathcal{J}_{g}(\rho, 0)+K_{0}(a)=-i \int_{0}^{b} e^{-a \cos \alpha} d \alpha, b=\mp i \ln \left(\epsilon \frac{\left(1 \mp \sin \theta_{1}\right)}{\cos \theta_{1}}\right), \tag{44}
\end{equation*}
$$

with $g=\sin \theta_{1}, a=\epsilon i k \rho \cos \theta_{1}, \epsilon=\operatorname{sign}\left(\operatorname{Re}\left(i k \rho \cos \theta_{1}\right)\right)$. Let us also notice that, in agreement with the reciprocity principle [8], we have $G_{a, b}\left(r, r^{\prime}\right)=G_{a, b}\left(r^{\prime}, r\right)$.

## Remark 5 :

We can use (24) in (43) for $g \rightarrow 1$, and notice that,

$$
\begin{equation*}
\left.\left(G_{a}\left(r, r^{\prime}\right)+G_{b}\left(r, r^{\prime}\right)\right)\right|_{z=z^{\prime}=0} \rightarrow 4\left(\frac{e^{-i k \rho}}{k \rho}-i\left(E_{1}(i k \rho)+\ln (\rho / d)\right)\right) \tag{45}
\end{equation*}
$$

which is regular for $\rho=0$ since $E_{1}(v)=-\ln (v)+O(1)$.

Remark 6 :
For $r^{\prime} \rightarrow \pm \infty, r-r_{i m}=2 \widehat{z}(\widehat{z} \cdot r)$, we have

$$
\begin{equation*}
G_{a}\left(r, r^{\prime}\right)=\frac{e^{-i k\left|r^{\prime}\right|}}{k\left|r^{\prime}\right|}\left(\left[e^{i k\left(r . r^{\prime}\right) /\left|r^{\prime}\right|}\left(1+e^{-2 i k\left(\frac{z}{z} \frac{r^{\prime}}{r^{\prime}}\right) \hat{z} . r}\left(\frac{\widehat{z} \frac{r^{\prime}}{\left|r^{\prime}\right|}-g}{\widehat{z} \frac{r^{\prime}}{\left|r^{\prime}\right|}+g}\right)\right)\right]+o(1)\right) \tag{46}
\end{equation*}
$$

## 4) Integral representation of the field with $G_{a}$ and $G_{b}$

## 4.1) The representation of the field from the second Green's theorem

Let us consider the pressure fields $p$ and $G$, satisfying the Helmholtz equation

$$
\begin{align*}
& \left(\Delta+k^{2}\right) p=W \\
& \left(\Delta+k^{2}\right) G=W_{G} \tag{47}
\end{align*}
$$

in the domain $\Omega$, bounded by the surface $\partial \Omega$, piecewise analytic. If the functions $p$ and $G$ have the regularity which permit the application of the second Green's theorem, we can write

$$
\begin{equation*}
\int_{\Omega} W(r) G(r) d V-\int_{\Omega} W_{G}(r) p(r) d V=\int_{\partial \Omega^{+}} \widehat{n} \cdot(\operatorname{grad}(G) p-\operatorname{grad}(p) G) d S \tag{48}
\end{equation*}
$$

where $\partial \Omega^{+}$denotes the internal surface to $\Omega, \widehat{n}$ is the unit normal, piecewise defined, directed inside $\Omega$, and the surface integral is taken in the sense of principal value of Cauchy. Thereafter, we omit the sign for $\partial \Omega^{+}$, and we write $\partial \Omega$ instead of $\partial \Omega^{+}$.

## 4.2) The case $W_{G}(r)=-w \delta\left(r-r^{\prime}\right)$

Let us consider $W_{G}(r)$ as a generalized function in (48), with $W_{G}(r)=-w \delta\left(r-r^{\prime}\right), w$ being a constant. In this case, we have

$$
\begin{equation*}
1_{\Omega}\left(r^{\prime}\right) p\left(r^{\prime}\right)-p_{i}\left(r^{\prime}\right)=\frac{1}{w} \int_{\partial \Omega} \widehat{n} \cdot\left(\operatorname{grad}\left(G\left(r, r^{\prime}\right)\right) p-\operatorname{grad}(p) G\left(r, r^{\prime}\right)\right) d S \tag{49}
\end{equation*}
$$

for $r^{\prime} \in \bar{\Omega}$, where

$$
\begin{align*}
& p_{i}=-\frac{1}{w} \int_{\Omega} W(r) G\left(r, r^{\prime}\right) d V \\
& 1_{\Omega}\left(r^{\prime}\right)=\int_{\Omega} \delta\left(r-r^{\prime}\right) d r=\frac{1}{4 \pi} \int_{\partial \Omega} \widehat{n} \operatorname{grad}\left(\frac{1}{\left|r^{\prime}-r\right|}\right) d S=\frac{1}{4 \pi} \int_{\partial \Omega} \frac{\left(r^{\prime}-r\right)}{\left|r^{\prime}-r\right|^{3}} \widehat{n} d S \tag{50}
\end{align*}
$$

and the integrals are considered in the sense of the principal value of Cauchy. The reader can easily recover $1_{\Omega}$, by letting $k=0, G\left(r, r^{\prime}\right)=\frac{w}{4 \pi\left|r^{\prime}-r\right|}$ and $p \equiv 1$.
remark 7 :
$1_{\Omega}=1$ in $\Omega,=0$ in $R^{3} \backslash \bar{\Omega}$, is fractional on $\partial \Omega\left(=\frac{1}{2}\right.$ when $\partial \Omega$ is smooth $),=0$ if $\Omega \equiv 0$. For an external problem in $R^{3} \backslash \Omega^{\prime}$, the surface can be considered to be closed at infinity so that $1_{\mathrm{R}^{3} \backslash \Omega^{\prime}}\left(r^{\prime}\right)=1-1_{\Omega^{\prime}}\left(r^{\prime}\right)$, where $\widehat{n}$ is the outward normal to $\Omega^{\prime}$.
remark 8 :
Considering the continuity of the single-layer potential in (50), we notice that

$$
\begin{align*}
& \left.\frac{1}{w} \int_{\partial \Omega}\left(\widehat{n} \cdot \operatorname{grad}\left(G\left(r, r^{\prime}\right)\right) p_{e}(r)-q_{e}(r) G\left(r, r^{\prime}\right)\right) d S\right|_{r^{\prime} \in \Omega \rightarrow r_{0} \in \partial \Omega} \\
& \rightarrow\left(1-1_{\Omega}\left(r_{0}\right)\right) p_{e}\left(r_{0}\right)+ \\
& +\frac{1}{w} \text { p.v. } \int_{\partial \Omega}\left(\widehat{n} \cdot \operatorname{grad}\left(G\left(r, r_{0}\right)\right) p_{e}(r)-q_{e}(r) G\left(r, r_{0}\right)\right) d S \tag{51}
\end{align*}
$$

when $p_{e}$ is continuous on $\partial \Omega, q_{e}(r) G\left(r, r^{\prime}\right)$ is summable and its integral is continuous.

## 4.4) Integral representation of the field above the plane and in the cavity

### 4.4.1) Integral representation of the field above the plane

From the definitions of $G_{a}$ and $p=p_{s}+p_{i n c}$, we can use the second Green's theorem for $\Omega$ tending to the infinite half-space $\Omega_{1}$ above the plane. Indeed, considering the condition (b), and the impedance boundary condition (3), satisfied by $p$ and $G_{a}$ on the plane $z=0$, the surface integral at infinity and on $S_{0} \backslash S_{1}$ vanishes, so that we obtain,

$$
\begin{equation*}
\left(1_{\Omega_{1}}\left(r^{\prime}\right)+1_{\Omega_{1}}\left(r_{i m}^{\prime}\right)\right) p\left(r^{\prime}\right)-p_{i}\left(r^{\prime}\right)=\frac{-k}{4 \pi} \int_{S_{1}} G_{a}\left(r, r^{\prime}\right)\left(\partial_{z} p(r)-i k g p(r)\right) d S \tag{52}
\end{equation*}
$$

for $z \geq 0$, where $\left(1_{\Omega_{1}}\left(r^{\prime}\right)+1_{\Omega_{1}}\left(r_{i m}^{\prime}\right)\right)=1$, and $p_{i}=\frac{-k}{4 \pi} \int_{\Omega_{1}} W(r) G_{a}\left(r, r^{\prime}\right) d V$ is the field in presence of the plane without cavity.

### 4.4.2) Integral representation of the field in the cavity

From the definitions of $G_{b}$ and $p=p_{s}+p_{i n c}$, we can use the second Green's theorem in the domain $\Omega_{2}$ of the cavity, which gives us,

$$
\begin{align*}
& \left(1_{\Omega_{2}}\left(r^{\prime}\right)+1_{\Omega_{2}}\left(r_{i m}^{\prime}\right)\right) p\left(r^{\prime}\right)+\frac{k}{4 \pi} \int_{\Omega_{2}} W(r) G_{b}\left(r, r^{\prime}\right) d V \\
& =\frac{k}{4 \pi} \int_{\partial \Omega_{2}} \widehat{n} \cdot\left(\operatorname{grad}\left(G_{b}\right) p-\operatorname{grad}(p) G_{b}\right) d S \tag{53}
\end{align*}
$$

where $1_{\Omega_{2}}\left(r^{\prime}\right)=\int_{\Omega_{2}} \delta\left(r-r^{\prime}\right) d r=\frac{1}{4 \pi} \int_{\partial \Omega_{2}} \frac{\left(r^{\prime}-r\right)}{\left|r^{\prime}-r\right|^{3}} \widehat{n} d S$, and $\widehat{n}$ is the unit normal to $S_{2}$ directed inside $\Omega_{2}$. Considering that the source $W$ is above the plane, and that $G_{b}$ (resp. p) satisfies the impedance boundary condition (3) (resp. (8)), the equation (53) becomes

$$
\begin{align*}
& \left(1_{\Omega_{2}}\left(r^{\prime}\right)+1_{\Omega_{2}}\left(r_{i m}^{\prime}\right)\right) p\left(r^{\prime}\right)=\frac{k}{4 \pi} \int_{S_{1}} G_{b}\left(r, r^{\prime}\right)\left(\partial_{z}(p(r))-i k g p(r)\right) d S \\
& +\frac{k}{4 \pi} \int_{S_{2}} p(r)\left(\partial_{n} G_{b}\left(r, r^{\prime}\right)-i k g_{c} G_{b}\left(r, r^{\prime}\right)\right) d S \tag{54}
\end{align*}
$$

where, we notice that,

$$
\begin{align*}
& \left(1_{\Omega_{2}}\left(r^{\prime}\right)+1_{\Omega_{2}}\left(r_{i m}^{\prime}\right)\right)=1 \text { in } \bar{\Omega}_{2} \backslash \bar{S}_{2} \\
& 1_{\Omega_{2}}\left(r_{i m}^{\prime}\right)=0 \text { when } r^{\prime} \in \bar{\Omega}_{2} \backslash \bar{S}_{1} \tag{55}
\end{align*}
$$

Remark 9 :
even if $\partial_{n}\left(\left.G_{b}\left(r, r^{\prime}\right)\right|_{r \in S_{2}}\right.$ diverges when $r^{\prime} \notin \partial \Omega_{2} \rightarrow r$, it is continuous when $r^{\prime}$ belongs to smooth parts of $S_{2}$.

## 5) The integral equations on the aperture $S_{1}$ and on the surface of the cavity $S_{2}$

On the aperture $S_{1}$, we can substract the equation (52) from (54), and obtain

$$
\begin{align*}
& \left(1_{\Omega_{2}}\left(r^{\prime}\right)+1_{\Omega_{2}}\left(r_{i m}^{\prime}\right)-1\right) p\left(r^{\prime}\right)+\left.p_{i}\left(r^{\prime}\right)\right|_{r^{\prime} \in S_{1}}= \\
& =\frac{k}{4 \pi} \int_{S_{1}}\left(G_{a}\left(r, r^{\prime}\right)+G_{b}\left(r, r^{\prime}\right)\right)\left(\partial_{z}(p(r))-i k g p(r)\right) d S \\
& +\frac{k}{4 \pi} \int_{S_{2}} p(r)\left(\partial_{n}\left(G_{b}\left(r, r^{\prime}\right)\right)-i k g_{c} G_{b}\left(r, r^{\prime}\right)\right) d S, \tag{56}
\end{align*}
$$

where we notice that $\left(1_{\Omega_{2}}\left(r^{\prime}\right)+1_{\Omega_{2}}\left(r_{i m}^{\prime}\right)\right)=1$ on $S_{1}$, except possibly on $S_{1} \cap S_{2}$, while, on the surface $\bar{S}_{2}$ of the cavity, we can write, from (54),

$$
\begin{align*}
& \left.\left(1_{\Omega_{2}}\left(r^{\prime}\right)+1_{\Omega_{2}}\left(r_{i m}^{\prime}\right)\right) p\left(r^{\prime}\right)\right|_{r^{\prime} \in \bar{S}_{2}}=\frac{k}{4 \pi} \int_{S_{1}} G_{b}\left(r, r^{\prime}\right)\left(\partial_{z}(p(r))-i k g p(r)\right) d S \\
& +\frac{k}{4 \pi} \int_{S_{2}} p(r)\left(\partial_{n}\left(G_{b}\left(r, r^{\prime}\right)\right)-i k g_{c} G_{b}\left(r, r^{\prime}\right)\right) d S \tag{57}
\end{align*}
$$

where $1_{\Omega_{2}}\left(r^{\prime}\right)=\int_{\Omega_{2}} \delta\left(r-r^{\prime}\right) d r=\frac{1}{4 \pi} \int_{\partial \Omega_{2}} \widehat{n} \cdot \operatorname{grad}\left(\frac{1}{\left|r^{\prime}-r\right|}\right) d S$ ( $=\frac{1}{2}$ on smooth parts), and the surface integrals are taken in the sense of principal value of Cauchy.
The integral equations (56)-(57) represent a system for two unknowns,

$$
\begin{align*}
& q_{1}(r)=\left.\left(\partial_{z}(p(r))-i \operatorname{kgp}(r)\right)\right|_{r \in S_{1}} \\
& p_{2}(r)=\left.p(r)\right|_{r \in S_{2}} \tag{58}
\end{align*}
$$

respectively on the aperture and on the surface of cavity, whose solution permits to express the field everywhere.

## 6) Uniqueness property of the integral equations

We consider the solutions of our integral equations, $q_{1}(r)$ on the aperture, and $p_{2}(r)$ on the surface of the cavity, which satisfy the conditions (a), so that $q_{1}=O\left(r^{\alpha}\right)$, $-1<\alpha \leq 0$, as the distance to edges or corners vanishes, and $p_{2}$ is continuous. We then study the uniqueness of $q_{1}$ and $p_{2}$ when $\operatorname{Re} g>0$ and $\operatorname{Re} g_{c}>0$, or $g=g_{c}=0$, and verify that $q_{1}$ and $p_{2}$ vanish when $p_{i} \equiv 0$.
For this, we show that we can define a field $p_{e}\left(r^{\prime}\right)$, derived from $q_{1}, p_{2}$ and $p_{i}$, which verifies $p_{2}\left(r^{\prime}\right)=p_{e}\left(r^{\prime}\right)$ on $S_{2}$ and $q_{1}\left(r^{\prime}\right)=\partial_{z} p_{e}\left(r^{\prime}\right)-i k g p_{e}\left(r^{\prime}\right)$ on $S_{1}$, and satisfies the boundary value problem with the conditions of uniqueness given in section 2 .

## 6.1) $A$ field $p_{e}\left(r^{\prime}\right)$ derived from $p_{2}$ and $q_{1}$

We consider the field $p_{e}$ derived, from $q_{1}$ and $p_{2}$, following

$$
\begin{equation*}
p_{e}\left(r^{\prime}\right)=\frac{-k}{4 \pi} \int_{S_{1}} G_{a}\left(r, r^{\prime}\right) q_{1}(r) d S+p_{i}\left(r^{\prime}\right) \tag{59}
\end{equation*}
$$

in the domain $\Omega_{1}$ above the plane, and,

$$
\begin{align*}
& p_{e}\left(r^{\prime}\right)=\left(1-\left(1_{\Omega_{2}}\left(r^{\prime}\right)+1_{\Omega_{2}}\left(r_{i m}^{\prime}\right)\right)\right) p_{2}\left(r^{\prime}\right)+\frac{k}{4 \pi} \int_{S_{1}} G_{b}\left(r, r^{\prime}\right) q_{1}(r) d S+ \\
& +\frac{k}{4 \pi} \int_{S_{2}} p_{2}(r)\left(\partial_{n} G_{b}\left(r, r^{\prime}\right)-i k g_{c} G_{b}\left(r, r^{\prime}\right)\right) d S \tag{60}
\end{align*}
$$

in the domain $\Omega_{2}$ of the cavity, where the surface integrals are taken in the sense of principal value of Cauchy.
The expression (60) verifies, like $G_{b}$, the Helmholtz equation in $\Omega_{2}$, while (59) satisfies, like $G_{a}$, the Helmholtz equation in $\Omega_{1}$ with the radiation conditions at infinity given in (b), and the impedance conditions on $S_{0} \backslash S_{1}$. Moreover, from the equation of continuity (51), the function $p_{e}\left(r^{\prime}\right)$ is continuous up to $S_{2}$.

It then remains to analyze the continuity through the aperture $S_{1}$ of the cavity, the impedance boundary condition on $S_{2}$, and the expressions of $q_{1}$ and $p_{2}$ with $p_{e}$. Therefore, we show that we have,

- $p_{e}\left(r^{\prime}\right)=p_{2}\left(r^{\prime}\right)$ on the surface of the cavity $S_{2}$;
- the continuity of $p_{e}\left(r^{\prime}\right)$ through the aperture $S_{1}$;
- the continuity of $\partial_{z} p_{e}\left(r^{\prime}\right)-i k g p_{e}\left(r^{\prime}\right)$ through $S_{1}$;
- $\partial_{z} p_{e}\left(r^{\prime}\right)-i k g p_{e}\left(r^{\prime}\right)=q_{1}\left(r^{\prime}\right)$ on $S_{1}$;
- $\partial_{n} p_{e}=i k g_{c} p_{2}$ on $S_{2}$,
in the case $p_{i} \equiv 0$, considered for the uniqueness.

## 6.2) $p_{e}\left(r^{\prime}\right)=p_{2}\left(r^{\prime}\right)$ on $S_{2}$

Substracting the integral equation (57) from (60) for $r^{\prime} \in S_{2}$, we obtain

$$
\begin{equation*}
p_{e}\left(r^{\prime}\right)+\left(1_{\Omega_{2}}\left(r^{\prime}\right)+1_{\Omega_{2}}\left(r_{i m}^{\prime}\right)-1\right) p_{2}\left(r^{\prime}\right)=\left(1_{\Omega_{2}}\left(r^{\prime}\right)+1_{\Omega_{2}}\left(r_{i m}^{\prime}\right)\right) p_{2}\left(r^{\prime}\right) \tag{61}
\end{equation*}
$$

on $S_{2}$, and thus,

$$
\begin{equation*}
\left.p_{e}\left(r^{\prime}\right)\right|_{r^{\prime} \in S_{2}}=p_{2}\left(r^{\prime}\right) \tag{62}
\end{equation*}
$$

## 6.3) Continuity of $p_{e}\left(r^{\prime}\right)$ through $S_{1}$

The integrals in the expressions (59) and (60) of $p_{e}\left(r^{\prime}\right)$ remain convergent when the point of observation approaches the aperture respectively above and below $S_{1}$. Morever, $\left(1_{\Omega_{2}}\left(r^{\prime}\right)+1_{\Omega_{2}}\left(r_{i m}^{\prime}\right)\right)=1$ in $\bar{\Omega}_{2} \backslash S_{2}$, and, from the integral equation (56) with $p_{i} \equiv 0$, the expressions (59) and (60) tend to the same limit, which proves the continuity of $p_{e}\left(r^{\prime}\right)$ through the aperture $S_{1}$.

## 6.4) Continuity of $\partial_{z^{\prime}} p_{e}\left(r^{\prime}\right)-i k g p_{e}\left(r^{\prime}\right)$, equal to $q_{1}\left(r^{\prime}\right)$ on $S_{1}$

Using (40) in the expressions (59) and (60) of $p_{e}\left(r^{\prime}\right)$, we can write

$$
\begin{align*}
& \partial_{z^{\prime}} p_{e}\left(r^{\prime}\right)-\left.i k g p_{e}\left(r^{\prime}\right)\right|_{z^{\prime}=h>0}=\left.\frac{-k}{4 \pi}\left(\frac{\partial .}{\partial z^{\prime}}\right) \int_{S_{1}} 2 G^{0}\left(r, r^{\prime}\right) q_{1}(r) d S\right|_{z^{\prime}=h}, \\
& \partial_{z^{\prime}} p_{e}\left(r^{\prime}\right)-\left.i k g p_{e}\left(r^{\prime}\right)\right|_{z^{\prime}=-h<0}=\left.\frac{k}{4 \pi}\left(\frac{\partial .}{\partial z^{\prime}}\right) \int_{S_{1}} 2 G^{0}\left(r, r^{\prime}\right) q_{1}(r) d S\right|_{z^{\prime}=-h}+ \\
& +\left.\frac{k}{4 \pi}\left(\frac{\partial .}{\partial z^{\prime}}-i k g\right) \int_{S_{2}} p_{2}(r)\left(\partial_{n}\left(G_{b}\left(r, r^{\prime}\right)\right)-i k g_{c} G_{b}\left(r, r^{\prime}\right)\right) d S\right|_{z^{\prime}=-h} \tag{63}
\end{align*}
$$

We then apply that,

$$
\begin{align*}
& \left(\frac{\partial .}{\partial z^{\prime}}-i k g\right) G_{b}\left(r, r^{\prime}\right) \rightarrow 0 \text { when } z^{\prime} \rightarrow 0, z \neq 0 \\
& \left.\left(\frac{\partial .}{\partial z^{\prime}}\right) G^{0}\left(r(x, y, 0), r^{\prime}\right)\right|_{z^{\prime}=h}=-\left.\left(\frac{\partial}{\partial z^{\prime}}\right) G^{0}\left(r(x, y, 0), r^{\prime}\right)\right|_{z^{\prime}=-h} \tag{64}
\end{align*}
$$

This implies that the contribution of the integral term along $S_{2}$ vanishes when $h \rightarrow 0$, and that we have the continuity of $\partial_{z} p_{e}\left(r^{\prime}\right)-i k g p_{e}\left(r^{\prime}\right)$ through the aperture $S_{1}$. Indeed, we then have

$$
\begin{equation*}
\pm\left.\left.\left(\partial_{z^{\prime}} p_{e}\left(r^{\prime}\right)-i k g p_{e}\left(r^{\prime}\right)\right)\right|_{z^{\prime}=h>0} \rightarrow \frac{-k}{4 \pi}\left(\frac{\partial}{\partial z^{\prime}}\right) \int_{S_{1}} 2 G^{0}\left(r, r^{\prime}\right) q_{1}(r) d S\right|_{z^{\prime}= \pm h} \tag{65}
\end{equation*}
$$

when $h \rightarrow 0$, while, by application of the discontinuity property of the normal derivative of the single-layer potential [14], substracting the relations in (65) for plus and minus signs, we can write

$$
\begin{equation*}
\partial_{z}\left(p_{e}\left(r^{\prime}\right)\right)-i k g p_{e}\left(r^{\prime}\right)=q_{1}\left(r^{\prime}\right) \text { on } S_{1} \tag{66}
\end{equation*}
$$

## 6.5) $\partial_{n} p_{e}\left(r^{\prime}\right)=i k g_{c} p_{e}$ on $S_{2}$

The field $p_{e}\left(r^{\prime}\right)$, defined by (60), satisfies the Helmholtz equation in $\Omega_{2}$, and we can write in this domain, from the second Green's theorem,

$$
\begin{align*}
& \left(1_{\Omega_{2}}\left(r^{\prime}\right)+1_{\Omega_{2}}\left(r_{i m}^{\prime}\right)\right) p_{e}\left(r^{\prime}\right)=\frac{k}{4 \pi} \int_{S_{1}} G_{b}\left(r, r^{\prime}\right)\left(\partial_{z}\left(p_{e}(r)\right)-i k g p_{e}(r)\right) d S+ \\
& +\frac{k}{4 \pi} \int_{S_{2}}\left(p_{e}(r) \partial_{n} G_{b}\left(r, r^{\prime}\right)-G_{b}\left(r, r^{\prime}\right) \partial_{n_{2}} p_{e}(r)\right) d S \tag{67}
\end{align*}
$$

We have proved that $\partial_{z}\left(p_{e}(r)\right)-i k g p_{e}(r)=q_{1}(r)$ on $S_{1}$ and $p_{e}(r)=p_{2}(r)$ on $S_{2}$, and substracting (67) from (60), we obtain

$$
\begin{equation*}
\frac{k}{4 \pi} \int_{S_{2}} G_{b}\left(r, r^{\prime}\right) \mu(r) d S=0 \tag{68}
\end{equation*}
$$

for $r^{\prime} \in \Omega_{2}$, with $\mu(r) \equiv \partial_{n} p_{e}(r)-i k g_{c} p_{e}(r)$.
The surface $S_{2}$, bounded by the curve $C_{1}$, is open, and, considering the domain of analyticity of $G_{b}\left(r, r^{\prime}\right)$, we can use the analytic continuation principle through $S_{1}$. So, the potential

$$
\begin{equation*}
\mathcal{P}\left(r^{\prime}\right)=\frac{k}{4 \pi} \int_{S_{2}} G_{b}\left(r, r^{\prime}\right) \mu(r) d S \tag{69}
\end{equation*}
$$

vanishes in the domain $\Omega \equiv \Omega_{2} \cup \Omega_{2}^{i}$, where $\Omega_{2}^{i}$ (resp. $S_{2}^{i}$ ) is the symmetric of $\Omega_{2}$ (resp. $S_{2}$ ) relative to the plane $z=0$. From the properties of $G_{b}, \mathcal{P}$ is also regular in $R^{3} \backslash\left(\Omega \cup \Omega_{c}\right)$, where $\Omega_{c}$ is the upper part of the cylinder along $z$-axis bounded by $S_{2}^{i}$.
It is then possible to prove that $\mu \equiv 0$. For this, two distinct proofs are detailed in appendix A, successively for $g=0$ or $g \rightarrow \infty$, and, for $g \neq 0,|g|<\infty$.

## 7) Some simplifications of the integral equations for a shallow cavity

The integrals with $\partial_{n}\left(\frac{e^{-i k\left|r-r_{i m}^{\prime}\right|}}{k\left|r-r_{i m}^{\prime}\right|}\right)$ terms, in the equations (56)-(57), becomes difficult to calculate when $\left|r-r_{i m}^{\prime}\right| \rightarrow 0$ and the depth vanishes. Therefore, we develop our integral equations in a new form, and analytical expressions are derived.

## 7.1) A new form of the integral terms for shallow cavity

For a shallow cavity, we let

$$
\begin{align*}
& G_{b s}\left(r, r^{\prime}\right)=G_{b}\left(r, r^{\prime}\right)-G_{s t}\left(r, r^{\prime}\right) \\
& G_{s t}\left(r, r^{\prime}\right)=\frac{1}{k\left|r-r^{\prime}\right|}+\frac{1}{k\left|r-r_{i m}^{\prime}\right|} \\
& r_{2}^{\prime}\left(r_{1}\right)=r_{1}+\alpha\left(r_{1}\right) \widehat{z} \in S_{2}, r_{1} \in S_{1}, \alpha\left(r_{1}\right) \in R \tag{70}
\end{align*}
$$

where $r_{2}^{\prime}\left(r_{1}\right)$ is the projection of $r_{1} \in S_{1}$ on $S_{2}$ along $z$. We then consider the domain $\Omega$
defined so that $1_{\Omega}\left(r^{\prime}\right)=1_{\Omega_{2}}\left(r^{\prime}\right)+1_{\Omega_{2}}\left(r_{i m}^{\prime}\right)$, and notice that

$$
\begin{align*}
& 1_{\Omega}\left(r^{\prime}\right) p_{2}\left(r^{\prime}\right) \\
& =\frac{p_{2}\left(r^{\prime}\right)}{4 \pi} \int_{\partial \Omega} \widehat{n} \operatorname{grad}\left(\frac{1}{\left|r-r^{\prime}\right|}\right) d S \\
& =\frac{k}{4 \pi} \int_{S_{2}} \widehat{n} \operatorname{grad}\left(G_{s t}\left(r, r^{\prime}\right)\right) p_{2}\left(r^{\prime}\right) d S \tag{71}
\end{align*}
$$

We can use this equation, and derive a new form of integrals along $S_{2}$ in our system of equations. So, we obtain, for $r^{\prime} \in S_{1}$,

$$
\begin{align*}
& p_{i}\left(r^{\prime}\right)-p_{2}\left(r_{2}^{\prime}\left(r^{\prime}\right)\right)=\frac{k}{4 \pi} \int_{S_{1}}\left(G_{a}\left(r, r^{\prime}\right)+G_{b}\left(r, r^{\prime}\right)\right) q_{1}(r) d S \\
& +\frac{k}{4 \pi} \int_{S_{2}} p_{2}(r)\left(\partial_{n}\left(G_{b s}\left(r, r^{\prime}\right)\right)-i k g_{c} G_{b}\left(r, r^{\prime}\right)\right) d S \\
& +\frac{k}{4 \pi} \int_{S_{2}}\left(p_{2}(r)-p_{2}\left(r_{2}^{\prime}\left(r^{\prime}\right)\right)\right) \partial_{n}\left(G_{s t}\left(r, r^{\prime}\right)\right) d S \tag{72}
\end{align*}
$$

while, for $r^{\prime} \in \bar{S}_{2}$,

$$
\begin{align*}
& -k \int_{S_{2}}\left(p_{2}(r)-p_{2}\left(r^{\prime}\right)\right) \partial_{n}\left(G_{s t}\left(r, r^{\prime}\right)\right) d S=k \int_{S_{1}} G_{b}\left(r, r^{\prime}\right) q_{1}(r) d S \\
& +k \int_{S_{2}} p_{2}(r)\left(\partial_{n_{2}}\left(G_{b s}\left(r, r^{\prime}\right)\right)-i k g_{c} G_{b}\left(r, r^{\prime}\right)\right) d S \tag{73}
\end{align*}
$$

Comparing with previous integral equations system, we notice that the term $\partial_{n}\left(\frac{1}{k \mid r-r_{i m}^{\prime m}}\right)$ is multiplied by terms that vanish as $\left|r-r_{i m}^{\prime}\right| \rightarrow 0$, so that the difficulty of calculus for a small cavity depth has disappeared. Let us remark that this modification can be applied whenever a part of $S_{2}$ is close to $S_{1}$.

## 7.2) The limit case of an impedance patch

In the limit case where $S_{2} \equiv S_{1}$, the integral with $\partial_{n} G_{s t}\left(r, r^{\prime}\right)$ vanishes, and $\partial_{n_{2}}\left(G_{b s}\left(r, r^{\prime}\right)\right)=i k g G_{b}\left(r, r^{\prime}\right)$, so that we obtain, for $r^{\prime} \in S_{1}$,

$$
\begin{align*}
& \left.k \int_{S_{1}} G_{b}\left(r, r^{\prime}\right)\left(q_{1}(r)+i k\left(g-g_{c}\right) p_{2}(r)\right) d S\right|_{z^{\prime}=0^{-}}=0 \\
& p_{i}\left(r^{\prime}\right)-p_{2}\left(r^{\prime}\right)=\left.\frac{k}{4 \pi} \int_{S_{1}} G_{a}\left(r, r^{\prime}\right) q_{1}(r) d S\right|_{z^{\prime}=0^{+}} \tag{74}
\end{align*}
$$

where $q_{1}(r)$ and $p_{2}(r)$ are $O(1)$. The first equation implies $q_{1}(r)=i k\left(g_{c}-g\right) p_{2}(r)$ (see appendix C), which leads us to recover the well-known integral equation [18] for an
impedance patch,

$$
\begin{equation*}
p_{2}\left(r^{\prime}\right)-p_{i}\left(r^{\prime}\right)=\frac{k}{4 \pi} \int_{S_{1}} G_{a}\left(r, r^{\prime}\right) i k\left(g-g_{c}\right) p_{2}(r) d S \tag{75}
\end{equation*}
$$

Remark 10 :
Let us notice that

$$
\begin{equation*}
\left.k \int_{S_{1}} G_{a}\left(r, r^{\prime}\right) \mu(r) d S\right|_{z^{\prime}=0^{+}}=0 \tag{76}
\end{equation*}
$$

when $\mu(r)=q_{1}(r)+i k\left(g-g_{c}\right) p_{2}(r)=O(1)$, implies $\mu(r) \equiv 0$ (see appendix C ).

## 7.3) On some Approximations for a small cavity, and validation.

### 7.3.1) Approximate expressions for a small cavity

For small dimensions of the cavity, we assume that

$$
\begin{align*}
& p_{2}(r)-p_{c}=o(1), p_{c}=\frac{\int_{S_{2}} p_{2} d S}{\int_{S_{2}} d S}, \\
& \int_{S_{2}}\left(p_{2}(r)-p_{c}\right) \int_{S_{2}} \partial_{n}\left(G_{b s(, s t)}\left(r, r^{\prime}\right)\right) d S d S^{\prime}=o(1), \\
& \int_{S_{1}}\left(q_{1}(r)-q_{c}\right) \int_{S_{2(, 1)}} G_{b(, a)}\left(r, r^{\prime}\right) d S^{\prime} d S=o(1), q_{c}=\frac{\int_{S_{1}} q_{1}(r) d S}{\int_{S_{1}} d S} . \tag{77}
\end{align*}
$$

In this case, we can calculate $q_{c}$ and $p_{c}$, by integration of our integral equations over $S_{2}$ and $S_{1}$, and define an approximate expression of the field radiated above the plane. For this, we use that,

$$
\begin{align*}
& \left(\Delta+k^{2}\right) G_{b s}\left(r, r^{\prime}\right)=-k^{2} G_{s t}\left(r, r^{\prime}\right), r^{\prime} \in S_{2}, r \in S_{1} \\
& \int_{\partial \Omega_{2}} \partial_{n_{2}} G_{b s}\left(r, r^{\prime}\right) d S=k^{2} \int_{\Omega_{2}} G_{s t}\left(r, r^{\prime}\right) d V, r^{\prime} \in S_{2} \\
& \partial_{z} G_{b s}\left(r, r^{\prime}\right)=i k g G_{b}\left(r, r^{\prime}\right), r^{\prime} \in S_{2}, r \in S_{1} \tag{78}
\end{align*}
$$

and,

$$
\begin{equation*}
\int_{S_{2}} \partial_{n} G_{b s}\left(r, r^{\prime}\right) d S=\int_{S_{1}} i k g G_{b}\left(r, r^{\prime}\right) d S+k^{2} \int_{\Omega_{2}} G_{s t}\left(r, r^{\prime}\right) d V, r^{\prime} \in S_{2} \tag{79}
\end{equation*}
$$

So, summing the integral equation (73) over $S_{2}$, we obtain

$$
\begin{align*}
& q_{c} \int_{S_{1}} \int_{S_{2}} G_{b}\left(r, r^{\prime}\right) d S^{\prime} d S=i k p_{c}\left(\int_{S_{2}} g_{c}-\int_{S_{1}} g\right) \int_{S_{2}} G_{b}\left(r, r^{\prime}\right) d S^{\prime} d S \\
& -k^{2} p_{c} \int_{\Omega_{2}} \int_{S_{2}} G_{s t}\left(r, r^{\prime}\right) d V+o(1) \tag{80}
\end{align*}
$$

and deduce that

$$
\begin{equation*}
q_{c}=i k p_{c}\left[\left(r_{c}\left(g_{c}\right)-g\right)+i k l_{c}\right]+o(1) \tag{81}
\end{equation*}
$$

where

$$
\begin{align*}
& r_{c}\left(g_{c}\right)=\frac{\int_{S_{2}} g_{c} \int_{S_{2}} G_{b}\left(r, r^{\prime}\right) d S^{\prime} d S}{\int_{S_{1}} \int_{S_{2}} G_{b}\left(r, r^{\prime}\right) d S^{\prime} d S} \sim \frac{\int_{S_{2}} g_{c} d S}{\int_{S_{1}} d S}, \\
& l_{c}=\frac{\int_{\Omega_{2}} \int_{S_{2}} G_{s t}\left(r, r^{\prime}\right) d V}{\int_{S_{1}} \int_{S_{2}} G_{b}\left(r, r^{\prime}\right) d S^{\prime} d S} \sim \frac{\int_{\Omega_{2}} d V}{\int_{S_{1}} d S} . \tag{82}
\end{align*}
$$

We then use the integral equation (72) for $r^{\prime} \in S_{1}$, and sum it over $S_{1}$. This gives us,

$$
\begin{equation*}
\int_{S_{1}} p_{i}(r) d S-p_{c} \int_{S_{1}} d S=\frac{k q_{c}}{4 \pi} \int_{S_{1}} \int_{S_{1}} G_{a}\left(r, r^{\prime}\right) d S^{\prime} d S(1+o(k)) \tag{83}
\end{equation*}
$$

so that we can write, for the approximate expressions of $p_{c}$ and $q_{c}$,

$$
\begin{align*}
p_{c} & =\frac{\int_{S_{1}} p_{i}(r) d S / \int_{S_{1}} d S}{1+\frac{i k}{4 \pi}\left[\left(r_{c}\left(g_{c}\right)-g\right)+i k l_{c}\right] \frac{k \int_{S_{1}} \int_{S_{1}} G_{a}\left(r, r^{\prime}\right) d S^{\prime} d S}{\int_{S_{1}} d S}}, \\
q_{c} & =i k p_{c}\left[\left(r_{c}\left(g_{c}\right)-g\right)+i k l_{c}\right], \tag{84}
\end{align*}
$$

The expression of $q_{c}$ can be used, for the field radiated by the cavity above the plane,

$$
\begin{equation*}
p\left(r^{\prime}\right)-p_{i}\left(r^{\prime}\right)=\frac{-k}{4 \pi} q_{c} \int_{S_{1}} G_{a}\left(r, r^{\prime}\right) d S+o(1) \tag{85}
\end{equation*}
$$

when $r^{\prime} \notin S_{1}$ and $k \int_{S_{1}}\left(q_{1}(r)-q_{c}\right) G_{a}\left(r, r^{\prime}\right) d S=o(1)$, in particular for the far field.

## Remark 11 :

In the case of a cavity $\Omega_{2}$ filled with a homogenous material, we can consider $G_{b}$ with $k_{2}$ instead of $k$, and $g_{2}=k g / k_{2}$ in place of $g$, and write

$$
\begin{equation*}
q_{c}=i k_{2} p_{c}\left[\left(r_{c}\left(g_{c}\right)-g_{2}\right)+i k_{2} l_{c}\right]+o(1) \tag{86}
\end{equation*}
$$

Remark 12 :
To our knowledge, our approximate expressions are original, but a similar low frequency analysis could also be done with the integral equations given in [1].

### 7.3.2) Validation in the case of a small cylindrical cavity with impedance wall

For the validation, we choose to compare the impedance on the aperture, expressed, from (81)-(82), by

$$
\begin{equation*}
\eta_{a}=\frac{\int_{S_{1}} \frac{\partial p}{\partial z} d S / \int_{S_{1}} d S}{i k p_{c}}=\frac{q_{c}}{i k p_{c}}+g=r_{c}\left(g_{c}\right)+i k l_{c} \sim \frac{\int_{S_{2}} g_{c} d S}{\int_{S_{1}} d S}+i k \frac{\int_{\Omega_{2}} d V}{\int_{S_{1}} d S}, \tag{87}
\end{equation*}
$$

with the impedance given for a cavity with well-tabulated results.
For this, we consider the particular case of a cylindrical cavity of radius $a$ and depth $d$ with an imperfectly reflective surface, characterized by impedances $g_{c w}$ on the wall and $g_{c e}$ on the bottom, with $k a=o(1)$ and $d / a=O(1)$. So, we have, from (87),

$$
\begin{equation*}
\eta_{a} \sim \frac{g_{c e} \pi a^{2}+g_{c w} 2 \pi a d}{\pi a^{2}}+i k \frac{\pi a^{2} d}{\pi a^{2}}=g_{c e}+\frac{2 g_{c w} d}{a}+i k d \tag{88}
\end{equation*}
$$

while, from the modal expansion of the field [19],

$$
\begin{align*}
& \left.\eta_{m}=\left.\frac{\frac{\partial p}{\partial z}}{i k p}\right|_{S_{1}} \simeq \frac{\alpha_{1}}{k} \frac{\left(1+\frac{g_{c e}-\frac{\alpha_{1}}{k_{1}}}{g_{c c}+\frac{\alpha_{1}}{k}} e^{-2 i \alpha_{1} d}\right)}{\left(1-\frac{g_{c c}-\frac{\alpha_{1}}{k}}{g_{c c}+\frac{\alpha_{1}}{k}}\right.} e^{-2 i \alpha_{1} d}\right)
\end{align*} g_{c e}+i \alpha_{1}^{2} \frac{d}{k} \simeq g_{c e}+\frac{2 g_{c w} d}{a}+i k d,
$$

As expected for a small cavity, $\eta_{m}$ perfectly recovers $\eta_{a}$, and the expression (87) is validated.

Remark 13 :
For a perfectly rigid small cavity, we have $g_{c}=0$ and thus $\eta_{a}=i k l_{c}$, and we recover the result given in [20, equ. (3)-(6)].

## 8) Conclusion

We have developed novel integral equations which permit to simplify the calculus of the field scattered by a cavity in an impedance plane. For this, a new Green's function is used for the expression of the field in the cavity which leads to reduce the number of unknowns. Moreover, a particular attention is paid to the uniqueness of the solution. In the case of a small cavity, our equations are detailed and developed in a new form. In this
case, analytical results are derived and our expression for approximate aperture impedance is validated.

## Appendix A :

$$
\int_{S_{2}(\text { open })} G_{b}\left(r, r^{\prime}\right) \mu(r) d S=0 \text { in } \Omega \equiv \Omega_{2} \cup \Omega_{2}^{i} \text { implies } \mu(r) \equiv 0
$$

This appendix concerns the study of the solution $\mu(r)$ of

$$
\begin{equation*}
\mathcal{P}\left(r^{\prime}\right)=0 \text { where } \mathcal{P}\left(r^{\prime}\right)=\frac{k}{4 \pi} \int_{S_{2}} G_{b}\left(r, r^{\prime}\right) \mu(r) d S \tag{90}
\end{equation*}
$$

when $S_{2}$ is open, and the proof that $\mu(r)$ (in some function class) vanishes.

## A.1) $\mu \equiv 0$ in the cases $g=0$ (Neumann) or $g \rightarrow \infty$ (Dirichlet)

In the respective cases $g=0$ (Neumann boundary condition) and $g \rightarrow \infty$ (Dirichlet boundary condition), we have

$$
\begin{align*}
& \left.G_{b}\left(r, r^{\prime}\right)\right|_{g=0}=\left[G^{0}\left(r-r^{\prime}\right)+G^{0}\left(r-r_{i m}^{\prime}\right)\right] \\
& \left.G_{b}\left(r, r^{\prime}\right)\right|_{g \rightarrow \infty}=\left[G^{0}\left(r-r^{\prime}\right)-G^{0}\left(r-r_{i m}^{\prime}\right)\right] \tag{91}
\end{align*}
$$

and thus,

$$
\begin{align*}
& \left.\mathcal{P}\left(r^{\prime}\right)\right|_{g=0}=\frac{k}{4 \pi} \int_{\partial \Omega} G^{0}\left(r-r^{\prime}\right) \Xi_{0}(r) d S \\
& \left.\mathcal{P}\left(r^{\prime}\right)\right|_{g \rightarrow \infty}=\frac{k}{4 \pi} \int_{\partial \Omega} G^{0}\left(r-r^{\prime}\right) \Xi_{\infty}(r) d S \tag{92}
\end{align*}
$$

where $\Xi_{0}\left(r_{i m}\right)=\Xi_{0}(r)=\mu(r)$ and $\Xi_{\infty}\left(r_{i m}\right)=-\Xi_{\infty}(r)=-\mu(r)$. We assume that $\mu$ is a function, piecewise continuous (except possibly for singularities of $\mu$ at the edge of $\partial \Omega$ ), so that $\mathcal{P}$ is continuous on $\partial \Omega$. We then use a proof similar to the ones given by Colton and Kress in [14] to prove that $\mu(r) \equiv 0$.
The potential $\mathcal{P}$ vanishes in $\Omega$, and thus, by continuity, on $\partial \Omega$. Moreover, $\mathcal{P}$ satisfies the Helmholtz equation and the Sommerfeld radiation condition at infinity in $R^{3}$. Hence by Rellich's uniqueness theorem generalized by Levine for non smooth domain [10], $\mathcal{P}\left(r^{\prime}\right)$ also vanishes outside $\Omega$. We can then conclude, from the discontinuity property of the normal derivative of the single layer potential [14],

$$
\begin{equation*}
\left.\frac{\partial \mathcal{P}\left(r^{\prime}\right)}{\partial n}\right|_{+}-\left.\frac{\partial \mathcal{P}\left(r^{\prime}\right)}{\partial n}\right|_{-}=-\Xi\left(r^{\prime}\right) \tag{93}
\end{equation*}
$$

at any non singular points of $S_{2}$, that $\Xi \equiv 0$ and thus $\mu \equiv 0$.

## A.2) A proof that $\mu \equiv 0$ for $g \neq 0,|g|<\infty$

When $g \neq 1$, we notice that $\left.G_{b}\left(r, r^{\prime}\right)\right|_{g=v}=\left.G_{a}\left(r_{i m}, r_{i m}^{\prime}\right)\right|_{g=-v}$, and the problem is then equivalent to a boundary value problem in the upper half-space, concerning a perturbation in relief on a plane of impedance $-g$, with a field vanishing inside and on the surface of the perturbation. For $\operatorname{Re}(-g)>0$, the uniqueness theorem of Levine [10, sect.7] applies, and we can deduce that $\mu \equiv 0$.
For $\operatorname{Re} g>0$, this demonstration is no more valid, and we develop here a more general proof which uses that $S_{2}$ is an open surface.

## A.2.1) Definition of the function $\mathcal{P}_{1}$

For this, we begin to define new functions $\mathcal{P}_{0}$ and $\mathcal{P}_{1}$, and we write,

$$
\begin{align*}
& \mathcal{P}\left(r^{\prime}\right)=\left(\mathcal{P}_{0}+2 i g \mathcal{P}_{1}\right) \\
& \mathcal{P}_{0}\left(r^{\prime}\right)=\frac{k}{4 \pi} \int_{S_{2}}\left(G^{0}\left(r-r^{\prime}\right)+G^{0}\left(r-r_{i m}^{\prime}\right)\right) \mu(r) d S \\
& \mathcal{P}_{1}\left(r^{\prime}\right)=\frac{k}{4 \pi} \int_{S_{2}} \mathcal{V}_{b}\left(r-r_{i m}^{\prime}\right) \mu(r) d S \tag{94}
\end{align*}
$$

where, from (21), the function $\mathcal{V}_{b}(r)=-e^{i k g z} \mathcal{J}_{-g}(\rho, z)$ satisfies

$$
\begin{align*}
& \frac{\partial \mathcal{V}_{b}\left(r-r_{i m}^{\prime}\right)}{\partial z}=\frac{e^{-i k\left|r-r_{i m}^{\prime}\right|}}{\left|r-r_{i m}^{\prime}\right|}+i k g \mathcal{V}_{b}\left(r-r_{i m}^{\prime}\right) \\
& =k G^{0}\left(r-r_{i m}^{\prime}\right)+i k g \mathcal{V}_{b}\left(r-r_{i m}^{\prime}\right) \tag{95}
\end{align*}
$$

We notice that $\mathcal{V}_{b}(r)$ is regular for $z<0$, and has a weak singularity, like $\ln \rho$, at $\rho=0$ for $z \geq 0$. Thus, the potential $\mathcal{P}_{1}\left(r^{\prime}\right)$ is an analytic function in $R^{3} \backslash \Omega_{c}$, i.e. everywhere except at points above the surface $S_{2}^{i}$, which is the image of $S_{2}$.

## A.2.2) A problem for $\mathcal{P}_{1}$ equivalent to the problem $\mathcal{P} \equiv 0$

Since $\mathcal{P}$ vanishes in $\Omega$, and $\mathcal{P}_{0}\left(r_{i m}^{\prime}\right)=\mathcal{P}_{0}\left(r^{\prime}\right)$, we can write that $\mathcal{P}_{1}\left(r_{\text {im }}^{\prime}\right)=\mathcal{P}_{1}\left(r^{\prime}\right)$ in this domain. So, we have

$$
\begin{align*}
& \mathcal{P}_{1}\left(r^{\prime}\right)=\frac{k}{4 \pi} \int_{S_{2}} \mathcal{V}_{b}\left(r-r_{i m}^{\prime}\right) \mu(r) d S \\
& \mathcal{P}_{1}\left(r_{i m}^{\prime}\right)=\mathcal{P}_{1}\left(r^{\prime}\right), r^{\prime} \in \Omega \equiv \Omega_{2} \cup \Omega_{2}^{i} \\
& \left(\Delta+k^{2}\right) \mathcal{P}_{1}=0 \text { in } R^{3} \backslash \Omega_{c} \tag{96}
\end{align*}
$$

where $S_{2}$ is an open surface. This implies reciprocally that $\mathcal{P} \equiv 0$. Indeed, we have

$$
\begin{equation*}
\partial_{z} \mathcal{P}_{1}\left(r^{\prime}\right)-i k g \mathcal{P}_{1}\left(r^{\prime}\right)=\frac{k}{4 \pi} \int_{S_{2}} k G^{0}\left(r-r_{i m}^{\prime}\right) \mu(r) d S \tag{97}
\end{equation*}
$$

Therefore, using the parity of $\mathcal{P}_{1}$ in $\Omega \equiv \Omega_{2} \cup \Omega_{2}^{i}$, we have $\partial_{z}\left(\mathcal{P}_{1}\left(r^{\prime}\right)+\mathcal{P}_{1}\left(r_{i m}^{\prime}\right)\right)=0$, and we can write, as $r^{\prime} \in \Omega$,

$$
\begin{equation*}
\frac{1}{k}\left(\partial_{z} \mathcal{P}_{1}\left(r^{\prime}\right)+\partial_{z} \mathcal{P}_{1}\left(r_{i m}^{\prime}\right)\right)=\frac{k}{4 \pi} \int_{S_{2}} G_{b}\left(r, r^{\prime}\right) \mu(r) d S=0 \tag{98}
\end{equation*}
$$

where we have used that $\mathcal{P}_{1}\left(r_{i m}^{\prime}\right)=\mathcal{P}_{1}\left(r^{\prime}\right)$ and $\mathcal{P}_{1}\left(r_{\text {im }}^{\prime}\right)+\mathcal{P}_{1}\left(r^{\prime}\right)=2 \mathcal{P}_{1}\left(r^{\prime}\right)$. This implies, by definition of $\mathcal{P}$, that $\mathcal{P}=0$ in $\Omega$, which shows the equivalence.

## A.2.3) a proof that $\mu \equiv 0$, by the analysis of the singularities at the ends of $S_{2}$

The singularities of the field at the ends of $S_{2}$, i.e. in vicinity of the curve $C_{1}$, depends on the geometry. For this, we denote $\widehat{n}_{0}$, the unit vector, normal to $C_{1}$ at $r_{0}$ and orthogonal to the normal $\widehat{n}$ to $S_{2}$, and $\widehat{c}$ the unit vector tangent to $C_{1}$, so that ( $\left.\widehat{c}, \widehat{n}, \widehat{n}_{0}\right)$ is an orthonormal basis (figure 4), and $(\rho, \varphi)$ the cylindrical coordinates associated to ( $\widehat{n}, \widehat{n}_{0}$ ), with $\rho \cos \varphi=\widehat{n}_{0} .\left(r-r_{0}\right), \rho \sin \varphi=-\widehat{n} .\left(r-r_{0}\right)$. We also denote $\widehat{y}$ the unit vector perpendicular to $\widehat{z}$ and to $\widehat{c}$ so that $(\widehat{c}, \widehat{y}, \widehat{z})$ is an orthonormal basis.

figure 4 : definitions of unit vectors on the curve $C_{1}$ limiting the aperture

Let us consider $S_{2}^{\prime}$, a part of $S_{2}$ bounded by an analytic $\operatorname{arc} C_{1}^{\prime}$ of $C_{1}$, and consider to simplify, without losing generality, that the function $\mu(r)$ satisfies

$$
\begin{align*}
& \mu(r)=\mu_{f}(r)+\mu_{a}(r) \\
& \mu_{f}(r)=\sum_{p \geq 1} a_{p} J_{\alpha_{p}}(k \rho), \\
& \mu_{a}(r)=\sum_{m \geq 0} b_{m} \rho^{m} \tag{99}
\end{align*}
$$

on $S_{2}^{\prime}$ where the $\alpha_{p}$ are not entire numbers, $\alpha_{p}<\alpha_{p+1}, \alpha_{1}>-1$, $a_{1} \neq 0$ except if $\mu_{f} \equiv 0$, and $J_{\nu}(z)=\left(\frac{z}{2}\right)^{\nu} \sum_{k \geq 0} \frac{(-z / 4)^{k}}{k!\Gamma(\nu+k+1)}$ is the bessel function of order $\nu$ [17]. The terms with powers of $\ln \rho$ could be considered in the method but are omitted for simplification. Thereafter, we prove that the conditions on $\mathcal{P}_{1}$ implies the vanishing of $\mu_{f}$ and $\mu_{a}$ on $S_{2}^{\prime}$, and that, by the continuation principle through a hole and the nullity of $\mathcal{P}$ in $\Omega_{2}, \mu \equiv 0$ on $S_{2}$. To simplify the analysis, we will only detail the demonstration in the case where $\left(\widehat{y} . \widehat{n}_{0}\right)=\cos \Phi^{\prime} \neq 0$.

## A.2.3.1) $\mu_{a}=0$ on $S_{2}^{\prime}$ when $\widehat{y} \cdot \widehat{n}_{0}=\cos \Phi^{\prime} \neq 0$ on $C_{1}^{\prime}$

Let us consider the analytic part of $\mu$ in vicinity of $C_{1}^{\prime}$ and the singularities of $\mathcal{P}_{1}$ induced by it. Since we have

$$
\begin{equation*}
\left(\partial_{z}\left(\partial_{y} \mathcal{P}_{1}\left(r^{\prime}\right)\right)-i k g\left(\partial_{y} \mathcal{P}_{1}\left(r^{\prime}\right)\right)\right)=\partial_{y} \frac{k}{4 \pi} \int_{S_{2}} k G^{0}\left(r-r_{i m}^{\prime}\right) \mu(r) d S \tag{100}
\end{equation*}
$$

a singularity appears (see [15] or appendix B), following

$$
\begin{equation*}
\partial_{y} \frac{k}{4 \pi} \int_{S_{2}} k G^{0}\left(r-r_{i m}^{\prime}\right) \mu(r) d S=-\frac{k \cos \Phi^{\prime}\left(r_{0}\right)}{2 \pi} \mu\left(r_{0}\right) \ln \left|r^{\prime}-r_{0}\right|+O(1) \tag{101}
\end{equation*}
$$

as $r^{\prime}$ tends normally to $q_{0} \in C_{1}^{\prime}$. This implies, from $\partial_{y} \mathcal{P}_{1}\left(r^{\prime}\right)=O(1)$, that

$$
\begin{equation*}
\partial_{z}\left(\partial_{y} \mathcal{P}_{1}\left(r^{\prime}\right)\right)=-\frac{k \cos \Phi^{\prime}\left(r_{0}\right)}{2 \pi} \mu\left(r_{0}\right) \ln \left|r^{\prime}-r_{0}\right|+O(1) \tag{102}
\end{equation*}
$$

Considering the parity of $\mathcal{P}_{1}\left(r^{\prime}\right)$, this equality is impossible except if $\mu\left(q_{0}\right)=0$. In the same manner, the case of higher order terms of $\mu_{a}, b_{1} \rho^{1}, b_{2} \rho^{2}, \ldots$ can be considered successively with higher order $y$-derivatives of $\mathcal{P}_{1}\left(r^{\prime}\right)$, so that $b_{m}=0, m \geq 0$.

## A.2.3.2) $\mu_{f}=0$ on $S_{2}^{\prime}$ for arbitrary $\cos \Phi^{\prime}$ on $C_{1}^{\prime}$

Let us consider the fractional part $\mu_{f}$ of $\mu$ and the single layer potential induced by it, in the expression (97) of $\partial_{z} \mathcal{P}_{1}\left(r^{\prime}\right)-i k g \mathcal{P}_{1}\left(r^{\prime}\right)$, when $S_{2}^{\prime}$ is assumed to simplify with null
curvature. From the appendix B, the potential has a fractional part of order $1+\alpha_{1}$ ( $\sim \rho^{1+\alpha_{1}}$ as $\rho \rightarrow 0$ ), which is thus the fractional order of $\partial_{z} \mathcal{P}_{1}\left(r^{\prime}\right)$. We then deduce that $\mathcal{P}_{1}$ has a fractional order $2+\alpha_{1}$. Since $J_{\alpha_{1}}(k \rho)$ radiates, for its fractional part, like $\frac{4 \pi}{k \sin (\nu \pi)} J_{1+\alpha_{1}}(k \rho) \cos \left(\left(1+\alpha_{1}\right) \varphi^{\prime}\right)+O\left(J_{3+\alpha_{1}}(k \rho)\right)$, which does not contains $\rho^{2+\alpha_{1}}$ terms in its expansion, the order $2+\alpha_{1}$ of $\mathcal{P}_{1}$ comes from the next term $a_{2} J_{\alpha_{2}}(k \rho)$. This implies $\alpha_{2}=\alpha_{1}+1$, and $a_{2} \neq 0$ if $a_{1} \neq 0$. Consequently, when $a_{1} \neq 0$, we can write,

$$
\begin{align*}
& \frac{k}{4 \pi} \int_{S_{2}} k G^{0}\left(r-r_{i m}^{\prime}\right) \mu(r) d S= \\
& =\frac{1}{\sin \left(\alpha_{1} \pi\right)}\left(a_{1} J_{1+\alpha_{1}}\left(k \rho^{\prime}\right) \cos \left(\left(1+\alpha_{1}\right) \varphi^{\prime}\right)-a_{2} J_{2+\alpha_{1}}\left(k \rho^{\prime}\right) \cos \left(\left(2+\alpha_{1}\right) \varphi^{\prime}\right)\right) \\
& +O\left(J_{3+\alpha_{1}}\left(k \rho^{\prime}\right)\right)+O\left(J_{1+\alpha_{3}}\left(k \rho^{\prime}\right)\right)+\text { entire function of } \rho^{\prime} \tag{103}
\end{align*}
$$

as $\rho^{\prime} \rightarrow 0, \rho^{\prime} \cos \varphi^{\prime}=\widehat{n}_{0} .\left(r^{\prime}-r_{0}\right), \rho^{\prime} \sin \varphi^{\prime}=-\widehat{n} .\left(r^{\prime}-r_{0}\right), \alpha_{3}>\alpha_{2}=\alpha_{1}+1$. Then, from (97), we have

$$
\begin{align*}
& \left.\left(\partial_{z} \mathcal{P}_{1}\left(r^{\prime}\right)\right)-i k g \mathcal{P}_{1}\left(r^{\prime}\right)\right) \\
& =\frac{1}{\sin \left(\alpha_{1} \pi\right)}\left(a_{1} J_{1+\alpha_{1}}\left(k \rho^{\prime}\right) \cos \left(\left(1+\alpha_{1}\right) \varphi^{\prime}\right)-a_{2} J_{2+\alpha_{1}}\left(k \rho^{\prime}\right) \cos \left(\left(2+\alpha_{1}\right) \varphi^{\prime}\right)\right) \\
& +O\left(J_{3+\alpha_{1}}\left(k \rho^{\prime}\right)\right)+O\left(J_{1+\alpha_{3}}\left(k \rho^{\prime}\right)\right)+\text { entire function of } \rho^{\prime} \tag{104}
\end{align*}
$$

From the parity of $\mathcal{P}_{1}$ and $\partial_{z} \mathcal{P}_{1}$, we then derive

$$
\begin{align*}
& a_{1} \cos \left(\left(1+\alpha_{1}\right) \Phi^{\prime}+\varphi\right)=-a_{1} \cos \left(\left(1+\alpha_{1}\right) \Phi^{\prime}-\varphi\right) \\
& a_{2} \cos \left(\left(2+\alpha_{1}\right) \Phi^{\prime}+\varphi\right)=a_{2} \cos \left(\left(2+\alpha_{1}\right) \Phi^{\prime}-\varphi\right) \tag{105}
\end{align*}
$$

Thus, when $a_{1} \neq 0$, we can write,

$$
\begin{align*}
& \cos \left(\left(1+\alpha_{1}\right) \Phi^{\prime}\right)=0 \\
& \sin \left(\left(2+\alpha_{1}\right) \Phi^{\prime}\right)=0 \tag{106}
\end{align*}
$$

This implies $\cos \Phi^{\prime}=0$, and $\alpha_{1}$ is entire, which is impossible. We then deduce that the first order coefficient $a_{1}$ of $\mu_{f}$ is null, which implies, by definition, that $\mu_{f} \equiv 0$.

## A.2.3.3) $\mu$ vanishes on $S_{2}^{\prime}$ implies $\mu \equiv 0$

From the previous results, it exists a subdomain $S_{2}^{\prime}$ of $S_{2}$ where $\mu=0$, that we can substract of the support of $\mu$, assuming without losing generality, that $\left|\cos \Phi^{\prime}\right| \neq 1$ along $C_{1}^{\prime}$. In this case, we can use the continuation principle through the hole $S_{2}^{\prime}$, and the field $\mathcal{P}\left(r^{\prime}\right)$, null in $\bar{\Omega}_{2}$, also vanishes outside the cavity below the plane $z=0$.

Noticing the regularity of $\mathcal{P}_{1}\left(r^{\prime}\right)$ for $z^{\prime}<0$, and thus the continuity of the normal derivative of $\mathcal{P}_{1}\left(r^{\prime}\right)$ through $S_{2}$, we can apply the discontinuity property of the normal derivative of single-layer potentials with free space Green's function [14],

$$
\begin{equation*}
\left.\frac{\partial \mathcal{P}\left(r^{\prime}\right)}{\partial n}\right|_{+}-\left.\frac{\partial \mathcal{P}\left(r^{\prime}\right)}{\partial n}\right|_{-}=-\mu(r) \tag{107}
\end{equation*}
$$

at any non singular points of $S_{2}$, then deduce, from the vanishing of the left side, that $\mu \equiv 0$.

## A.2.4) elements of proof for the particular case $\widehat{y} \cdot \widehat{n}_{0}=\cos \Phi^{\prime}=0$ on $C_{1}$

From the previous analysis, the fractional part $\mu_{f}$ vanishes, and we can assume that $\mu$ is analytic. In this case, we can choose to study the function,

$$
\begin{equation*}
\mathcal{P}^{\prime}\left(r^{\prime}\right)=\left(\partial_{z^{\prime}}-i k g\right) \mathcal{P}\left(r^{\prime}\right)=\frac{k}{4 \pi} \int_{S_{2}} G_{b}^{\prime}\left(r, r^{\prime}\right) \mu(r) d S \tag{108}
\end{equation*}
$$

where, from (39),

$$
\begin{align*}
& G_{b}^{\prime}\left(r, r^{\prime}\right)=\partial_{z^{\prime}}\left(G^{0}\left(r-r^{\prime}\right)+G^{0}\left(r-r_{i m}^{\prime}\right)\right)-i k g\left(G^{0}\left(r-r^{\prime}\right)-G^{0}\left(r-r_{i m}^{\prime}\right)\right) \\
& =\left(-\partial_{z}-i k g\right)\left(G^{0}\left(r-r^{\prime}\right)-G^{0}\left(r-r_{i m}^{\prime}\right)\right) \tag{109}
\end{align*}
$$

The function $\mathcal{P}^{\prime}$ and its derivatives vanish in $\Omega$, since $\mathcal{P}=0$ in $\Omega$. Let us show that it is also the case for $\mathcal{P}^{\prime}$ outside $\Omega$, then for $\mathcal{P}$, and thus for $\mu$.
Since $\mathcal{P}^{\prime}$ vanishes along the plane $z=0,(\widehat{z} . \operatorname{grad})^{2 n} \mathcal{P}^{\prime}=0$ along $C_{1}$. Using integration by parts and continuity, we have $(\widehat{z} . \text { grad })^{2 n+1} \mathcal{P}^{\prime}=0$ along $C_{1}$. Considering to simplify that the cylinder $S_{c}$ along $z$-axis defined with a section $C_{1}$ does not have common points with $S_{2}$, except on $C_{1}$, we then deduce that $\mathcal{P}^{\prime}$ vanishes on $S_{c}$ and thus, by uniqueness principle, everywhere. Since $\mathcal{P}$ and all $z$-derivatives of $\mathcal{P}^{\prime}$ vanishes on $S_{2}, \mathcal{P}$ vanishes below $S_{2}$, and, by continuation principle, everywhere below the plane $z=0$.
We can then use the discontnuity property of the normal derivative of single layer potential (107), and deduce that $\mu \equiv 0$.

## Appendix B :

## behaviour of single layer potentials on open surfaces

Let $S$ be an open analytic, orientable surface in three-dimensional space bounded by a Jordan curve $C$, and $C^{\prime}$ an arc belonging to it. Let $r^{\prime}$ and $r$ be two points, and $\mu(r)$ an analytical function defined for all $r \in S$ except possibly for a singularity on the edge $C^{\prime}$.

We study the behaviour of single potentials

$$
\begin{equation*}
U_{0}\left(r^{\prime}\right)=\int_{S} \frac{\mu(r)}{\left|r-r^{\prime}\right|} d S_{q}, U_{k}\left(r^{\prime}\right)=\int_{S} \frac{\mu(r) e^{-i k\left|r-r^{\prime}\right|}}{\left|r-r^{\prime}\right|} d S_{q} \tag{110}
\end{equation*}
$$

## B.1) Principal part of $\operatorname{grad}\left(U_{0}\left(r^{\prime}\right)\right)$ when $\mu(r)=O(1)$ on $C^{\prime}$

If $\mu(r)$ is finite on $C^{\prime}$, we can write, from Rolf Leis [15], in vicinity of $C^{\prime}$

$$
\begin{align*}
& \operatorname{grad}\left(U_{0}\left(r^{\prime}\right)\right)=-\int_{S} \mu(r) \widehat{n} \frac{\partial}{\partial n} \frac{1}{\left|r-r^{\prime}\right|} d S_{q}+\int_{S} \frac{\operatorname{grad}_{S}(\mu(r))}{\left|r-r^{\prime}\right|} d S_{q}+2 \int_{S} \frac{\widehat{n} H \mu(r)}{\left|r-r^{\prime}\right|} d S_{q} \\
& -\int_{C} \frac{\widehat{n}_{0} \mu(r)}{\left|r-r^{\prime}\right|} d c \tag{111}
\end{align*}
$$

where $\widehat{n}_{0}$ is a unit vector, normal to $C$ and orthogonal to the normal $\widehat{n}, \operatorname{grad}_{S}$ is the surface gradient, $H$ is a function depending on the characteristics of the surface. The line integral becomes logarithmically singular, while the other surface integrals are regular. The singularity, as $r^{\prime} \notin C \rightarrow r_{0}, r_{0}$ being the projection of $r^{\prime}$ on $C^{\prime}$, can be described by

$$
\begin{equation*}
\int_{C} \frac{\widehat{n}_{0} \mu(r)}{\left|r-r^{\prime}\right|} d c=-2 \widehat{n}_{0}\left(r_{0}\right) \mu\left(r_{0}\right) \ln \left|r^{\prime}-r_{0}\right|+O(1) \tag{112}
\end{equation*}
$$

where $\widehat{c}$ is the unit vector, tangent to $C^{\prime}$ at $r_{0}$, and $\left(\widehat{c}, \widehat{n}, \widehat{n}_{0}\right)$ is an orthonormal basis.

## B.2) Principal fractional part of $U_{k}\left(r^{\prime}\right)$ when $\mu(r)$ is of fractional order

In the case of $\mu(r)$ of fractional order (with fractional power of $\left|r-r_{0}\right|$ near $r_{0} \in C^{\prime}$ ), it is possible to analyze the fractional part of the field, letting the curvature of the edge $C^{\prime}$ tending to 0 . In this case, we can write,

$$
\begin{align*}
& U_{k}\left(r^{\prime}\right) \sim-i \pi \int_{L} \mu_{f}(\rho) H_{0}^{(2)}\left(k\left|\bar{\rho}-\bar{\rho}^{\prime}\right|\right) d \rho \\
& \sim-i \int_{-i \infty}^{+i \infty} \int_{0}^{\infty} \mu_{f}(\rho) e^{-i k \rho \cos \alpha} d \rho e^{-i k \rho^{\prime} \cos \left(\alpha-\varphi^{\prime}\right)} d \alpha \tag{113}
\end{align*}
$$

when $\rho^{\prime} \rightarrow 0, \rho^{\prime}$ denoting the radial distance to the edge of the point $r^{\prime}$, with $\rho^{\prime} \cos \left(\varphi^{\prime}\right)=\widehat{n}_{0}\left(r^{\prime}-r_{0}\right), \rho^{\prime} \sin \left(\varphi^{\prime}\right)=-\widehat{n}\left(r^{\prime}-r_{0}\right), r_{0} \in C^{\prime}$, and $\mu_{f}(\rho)=\mu(r)$.

So, for $\mu_{f}(\rho)=J_{\nu}(k \rho) \sim\left(\frac{\beta}{k}\right)^{-\nu} \lim _{\beta \rightarrow 0} J_{\nu}(\beta \rho), \nu>-1, \nu \neq 0,1,2, \ldots$, we obtain $U_{k}\left(r^{\prime}\right)$, from [16, eq. 6.611.1], following

$$
\begin{align*}
& U_{k}\left(r^{\prime}\right) \sim-\frac{i e^{-i(1+\nu) \pi / 2}}{k 2^{\nu}} \int_{-i \infty}^{+i \infty} \frac{1}{(\cos \alpha)^{1+\nu}} e^{-i k \rho^{\prime} \cos \left(\alpha-\varphi^{\prime}\right)} d \alpha \\
& \sim-\frac{i e^{-i(1+\nu) \pi / 2}}{k 2^{\nu}} \int_{0}^{+i \infty}\left(\frac{1}{\left(\cos \left(\alpha+\varphi^{\prime}\right)\right)^{1+\nu}}+\frac{1}{\left(\cos \left(\alpha-\varphi^{\prime}\right)\right)^{1+\nu}}\right) e^{-i k \rho^{\prime} \cos \alpha} d \alpha \\
& \sim-\frac{i 4 e^{-i(1+\nu) \pi / 2}}{k} \cos \left((1+\nu) \varphi^{\prime}\right) \int_{0}^{+i \infty} e^{i(1+\nu) \alpha} e^{-i k \rho^{\prime} \cos \alpha} d \alpha \\
& \sim \frac{4 \pi}{k \sin (\nu \pi)} \cos \left((1+\nu) \varphi^{\prime}\right)\left(J_{1+\nu}\left(k \rho^{\prime}\right)+\text { an entire function of } \rho^{\prime}\right) \tag{114}
\end{align*}
$$

Then, we can rewrite (114), using the discontinuity property of the normal derivative of $U_{k}$ through $S$ [14], and $2(1+\nu) J_{1+\nu}\left(k \rho^{\prime}\right) / k \rho^{\prime}=J_{\nu}\left(k \rho^{\prime}\right)+J_{2+\nu}\left(k \rho^{\prime}\right)$ [17], following

$$
\begin{equation*}
U_{k}\left(r^{\prime}\right)=\frac{4 \pi}{k \sin (\nu \pi)} J_{1+\alpha_{1}}\left(k \rho^{\prime}\right) \cos \left(\left(1+\alpha_{1}\right) \varphi^{\prime}\right)+O\left(J_{3+\alpha_{1}}\left(k \rho^{\prime}\right)\right)+U_{a}(p) \tag{115}
\end{equation*}
$$

where $U_{a}\left(r^{\prime}\right)$ is an entire function of $\rho^{\prime}$.

## Remark 14 :

In the case of logarithmic behaviour, we can let $\mu(\rho)=\frac{1}{2} \ln \left(\frac{\rho}{2}\right)=\lim _{\nu \rightarrow 0^{+}} \partial_{\nu}\left(K_{\nu}(\rho) / \Gamma(\nu)\right)$, and derive, from [16, eq. 6.611.3],

$$
\begin{align*}
& U_{k}(p) \sim-\left.i \int_{-i \infty}^{+i \infty} \partial_{\nu}\left(\frac{\Gamma(1-\nu) \sin \nu \alpha}{\sin \alpha}\right)\right|_{\nu=0} e^{-i k \rho^{\prime} \cos \left(\alpha-\varphi^{\prime}\right)} d \alpha \\
& \sim-i \int_{-i \infty}^{+i \infty}\left(\gamma \alpha+\frac{\alpha}{\sin \alpha}\right) e^{-i k \rho^{\prime} \cos \left(\alpha-\varphi^{\prime}\right)} d \alpha, \gamma=.577 \ldots \\
& \sim-i \gamma \varphi^{\prime} \int_{-i \infty}^{+i \infty} e^{-i k \rho^{\prime} \cos \alpha} d \alpha+o(\ln \rho)=2 \gamma \varphi^{\prime} K_{0}(i k \rho)+o(\ln \rho) \tag{116}
\end{align*}
$$

## Remark 15 :

Let $t_{0}\left(r_{0}\right)=a \widehat{n}_{0}\left(r_{0}\right)+b \widehat{n}\left(r_{0}\right)$ when $t_{0} \widehat{n}_{0} \neq 0$. Considering higher derivatives of $U_{0}$, we can write

$$
\begin{align*}
& \left(t_{0} \cdot \operatorname{grad}\right)^{n}\left(U_{0}\left(r^{\prime}\right)\right)=-\int_{S}\left(t_{0} \cdot \operatorname{grad}_{S}\right)^{n-1}(\mu(r))\left(t_{0} \cdot \widehat{n}\right) \frac{\partial}{\partial n}\left(\frac{1}{\left|r-r^{\prime}\right|}\right) d S \\
& +2 \int_{S} \frac{\left(t_{0} \cdot \widehat{n}\right) H\left(t_{0} \cdot \operatorname{grad}_{S}\right)^{n-1}(\mu(r))}{\left|r-r^{\prime}\right|} d S+\int_{S} \frac{\left(t_{0} \cdot \operatorname{grad}_{S}\right)^{n}(\mu(r))}{\left|r-r^{\prime}\right|} d S \\
& -t_{0} \int_{C} \frac{\left(t_{0} \cdot \widehat{n}_{0}\right)\left(t_{0} \cdot \operatorname{grad}_{S}\right)^{n-1}(\mu(r))}{\left|r-r^{\prime}\right|} d c+\mathcal{R}_{n} \tag{117}
\end{align*}
$$

when $\left(\widehat{n}_{0} \operatorname{grad}_{S}\right)^{j}\left(\mu\left(r_{0}\right)\right)=0\left(\right.$ or $\left(t_{0}\left(r_{0}\right) \operatorname{grad}_{S}\right)^{j}\left(\mu\left(r_{0}\right)\right)=0$ when $\left.t_{0} \widehat{n}_{0} \neq 0\right)$ on $C^{\prime}$, for $j<n-1$, $\left(\widehat{n}_{0} \operatorname{grad}_{S}\right)^{n-1}\left(\mu\left(r_{0}\right)\right)=O(1)$, and, in this case, $\mathcal{R}_{n}$ is continuous on $C^{\prime}$. This result also applies if we replace $U_{0}$ by $U_{k}$ since the behaviour of highest rank is the same for $U_{k}$ and $U_{0}$.

## Appendix C:

$\left.\int_{S_{1}} G_{b(a)}\left(r, r^{\prime}\right) \mu(r) d S\right|_{z=0^{-}}=0$ on $S_{1}$ implies $\mu(r) \equiv 0$ when $\mu(r)=A_{0}+o(1)$

Let us show that

$$
\begin{equation*}
\mathcal{U}\left(r^{\prime}\right)=\left.\int_{S_{1}} G_{b(a)}\left(r, r^{\prime}\right) \mu(r) d S\right|_{z=0^{-}}=0 \text { on } S_{1} \tag{118}
\end{equation*}
$$

implies $\mu(r) \equiv 0$, when $\mu(r)=A_{0}+o(1)$ as $r \rightarrow r_{c} \in \partial S_{1} \equiv C_{1}, A_{0}$ is a constant.

## C.1) the case with $G_{b}$

From the analysis of Rolf Leis (see [15] or appendix $B$ ), $\mu(r)=A_{0}+o(1)$ as $r \rightarrow r_{c} \in \partial S_{1}=C_{1}$ induces a singularity of tangential derivative in vicinity of $C_{1}$ of the form $A_{0} \ln \left|r-r_{c}\right|$. This implies, from $\left.\mathcal{U}\left(r^{\prime}\right)\right|_{S_{1}} \equiv 0$, that $A_{0}=0$.
We then choose to define the following functions $u$ and $w$,

$$
\begin{align*}
& u\left(r^{\prime}\right)=\frac{-k}{4 \pi} \int_{S_{1}} G_{b}\left(r, r^{\prime}\right) \mu(r) d S \text { with } u\left(r^{\prime}\right)=0 \text { on } S_{1} \\
& w\left(r^{\prime}\right)=\left(\frac{\partial}{\partial z^{\prime}}-i k g\right) u\left(r^{\prime}\right)=\frac{-2 k}{4 \pi} \int_{S_{1}}\left(\frac{\partial .}{\partial z^{\prime}}\right) G^{0}\left(r, r^{\prime}\right) \mu(r) d S \tag{119}
\end{align*}
$$

where we have used that

$$
\begin{align*}
& \left(\frac{\partial .}{\partial z^{\prime}}-i k g\right) G_{b}\left(r, r^{\prime}\right) \\
& =\left(\frac{\partial .}{\partial z^{\prime}}\right)\left(G^{0}\left(r-r^{\prime}\right)+G^{0}\left(r-r_{i m}^{\prime}\right)\right)-i k g\left(G^{0}\left(r-r^{\prime}\right)-G^{0}\left(r-r_{i m}^{\prime}\right)\right) \tag{120}
\end{align*}
$$

Considering the property of the double layer potential with free space Green's function $G^{0}$, and $F$ the radiation pattern (or scattering diagram) of $w$, we can write

$$
\begin{align*}
& w\left(r^{\prime}\right)=-\mu\left(r^{\prime}\right)=O(1) \text { on } S_{1}, w\left(r^{\prime}\right)=0 \text { on } S_{0} \backslash \bar{S}_{1} \\
& w\left(r^{\prime}\right)=\frac{e^{-i k\left|r^{\prime}\right|}}{\left|r^{\prime}\right|}\left(F\left(\frac{r^{\prime}}{\left|r^{\prime}\right|}\right)+o(1)\right) \text { when } r^{\prime} \rightarrow \infty \tag{121}
\end{align*}
$$

From Leis's second theorem [15],

$$
\begin{equation*}
\operatorname{grad}(w(r))=o\left(1 /\left|r-r_{c}\right|\right) \tag{122}
\end{equation*}
$$

when $r \rightarrow r_{c} \in C$, and, from $u(r)=0$ on $S_{1}$, we have

$$
\begin{equation*}
\lim _{z^{\prime} \rightarrow 0^{-}} \frac{\partial w(r)}{\partial z}=\left(k^{2}-\frac{\partial^{2}}{\partial x^{2}}-\frac{\partial^{2}}{\partial y^{2}}\right) u(r)-i k g w(r) \rightarrow-i k g w(r) \text { on } S_{1} \tag{123}
\end{equation*}
$$

Thus, we can apply the Green's first theorem on the domain $z<0$, and we obtain

$$
\begin{align*}
& \operatorname{Re}\left(\int_{z \leq 0^{-}}-i k|w(r)|^{2}+\frac{|\operatorname{grad} w(r)|^{2}}{-i k} d V\right)=\left(\int_{z=0^{-}} \operatorname{Re}(g)|w(r)|^{2} d S+\right. \\
& +\operatorname{Re}\left(\int_{0}^{2 \pi} \int_{\pi / 2}^{\pi}|F(\Theta, \phi)|^{2} \sin \Theta d \Theta d \phi\right) \tag{124}
\end{align*}
$$

For $\operatorname{Re}(g) \geq 0$ and $|\arg (i k)| \leq \pi / 2$, the left-hand term is $\leq 0$, while the right-hand term is $\geq 0$, and thus both terms vanish. So, we have,

$$
\begin{align*}
& w(r)=0 \text { as } z<0, \text { when }|\arg (i k)|<\pi / 2, \operatorname{Re}(g) \geq 0 \\
& w(r)=0 \text { as } z=0^{-}, \text {when }|\arg (i k)|=\pi / 2, \operatorname{Re}(g)>0 \tag{125}
\end{align*}
$$

which implies in these cases, from $w\left(r^{\prime}\right)=-\mu\left(r^{\prime}\right)$ on $S_{1}$, that $\mu$ vanishes.
In the case $g=0, G_{b}$ can be replaced by $2 G_{0}$ in the definition of $u$, and the demonstration of Colton and Kress [14, sect. 2], can be directly used to conclude that $\mu \equiv 0$.

## Remark 16 :

the same property can be deduced for $\operatorname{Re} g<0$, except along the branch-cut of $G_{b}$ with $\operatorname{Re}\left(i k \cos \theta_{1}\right)=0, g=\sin \theta_{1}$. For this, we can directly use the first Green's theorem with $u$ instead of $w$, and deduce that $\mu \equiv 0$.

## C.2) the case with $G_{a}$

If we consider in the definitions of $u, G_{a}$ instead of $G_{b}$, and the domain $z>0$ instead of the domain $z<0$, we can directly use the first Green's theorem with $u$ instead of $w$, and deduce that $\mu\left(r^{\prime}\right)=0$ when $\operatorname{Re}(g)>0$ or $g=0$.

## Appendix D :

## The Green's tensors for an impedance plane in electromagnetism

In our method, a key point is the use of the 'below' Green's functions in the cavity which derives from our solution for an arbitrary impedance plane (passive or active). In a similar manner, an extension of our work to electromagnetism is based primarily on the Green's tensors for an arbitrary impedance plane, which are now developed from [3]-[4]. We consider, the electromagnetic field $(E, H)$ that satisfies the Maxwell equation,

$$
\begin{equation*}
\operatorname{curl}(E)=-i k\left(Z_{0} H\right)-M, \operatorname{curl}\left(Z_{0} H\right)=i k E+Z_{0} J \tag{126}
\end{equation*}
$$

above the plane, and the impedance boundary conditions,

$$
\begin{equation*}
\left.\widehat{z} \wedge E\right|_{z=0}=\left.g^{e}\left(\widehat{z} \wedge \widehat{z} \wedge\left(Z_{0} H\right)\right)\right|_{z=0} \tag{127}
\end{equation*}
$$

or

$$
\begin{equation*}
\left.\left(\partial_{z}-i k g^{e}\right) E_{z}\right|_{z=0}=0,\left.\left(\partial_{z}-i k / g^{e}\right) H_{z}\right|_{z=0}=0 \tag{128}
\end{equation*}
$$

The incident field, radiated by the sources $J$ and $M$ in free space, is given by

$$
\begin{align*}
& E_{\text {inc }}=\operatorname{curl}(G * M)+\frac{i}{k}\left(\operatorname{grad}(\operatorname{div}(.))+k^{2}\right)\left(G * Z_{0} J\right) \\
& =\frac{1}{8 \pi k^{2}}\left(-M *\left[\underline{\mathcal{D}}_{e, i}\left(r^{\prime}, r\right)\right]+Z_{0} J *\left[\underline{\mathcal{F}}_{h, i}\left(r^{\prime}, r\right)\right]\right) \\
& Z_{0} H_{\text {inc }}=-\operatorname{curl}\left(G * Z_{0} J\right)+\frac{i}{k}\left(\operatorname{grad}(\operatorname{div}(.))+k^{2}\right)(G * M) \\
& =\frac{1}{8 \pi k^{2}}\left(Z_{0} J *\left[\underline{\mathcal{D}}_{h, i}\left(r^{\prime}, r\right)\right]+M *\left[\underline{\mathcal{F}}_{e, i}\left(r^{\prime}, r\right)\right]\right) \tag{129}
\end{align*}
$$

where $G=-\frac{e^{-i k|r| r \mid}}{4 \pi|r|},|r|=\sqrt{x^{2}+y^{2}+z^{2}}$, and $*$ is the convolution product.

Developing the expressions of potentials given in [3]-[4] for the scattered field $\left(E_{s}, H_{s}\right)$, we can write, when $M=M_{r^{\prime}} \delta\left(r-r^{\prime}\right)$ and $J=J_{r^{\prime}} \delta\left(r-r^{\prime}\right)$,

$$
\begin{align*}
& E_{s}(r)=-i k \operatorname{curl}\left(\mathcal{H}_{s} \widehat{z}\right)+\left(\operatorname{grad}(\operatorname{div}(.))+k^{2}\right)\left(\mathcal{E}_{s} \widehat{z}\right) \\
& =\frac{1}{8 \pi k^{2}}\left(\left[\underline{\mathcal{F}}_{h e}\left(r, r^{\prime}\right)\right] \cdot Z_{0} J_{r^{\prime}}-\left[\underline{\mathcal{D}}_{h e}\left(r, r^{\prime}\right)\right] \cdot M_{r^{\prime}}\right) \\
& =\frac{1}{8 \pi k^{2}}\left(Z_{0} J_{r^{\prime}} \cdot\left[\underline{\mathcal{F}}_{h e}\left(r^{\prime}, r\right)\right]-M_{r^{\prime}} \cdot\left[\underline{\mathcal{D}}_{e h}\left(r^{\prime}, r\right)\right]\right) \\
& =\frac{1}{8 \pi k^{2}}\left(Z_{0} J_{r^{\prime}} \cdot\left[\frac{1}{i k} \operatorname{curl}_{r^{\prime}}\left(\left[\underline{\mathcal{D}}_{e h}\left(r^{\prime}, r\right)\right]\right)\right]-M_{r^{\prime}} \cdot\left[\underline{\mathcal{D}}_{e h}\left(r^{\prime}, r\right)\right]\right) \tag{130}
\end{align*}
$$

and

$$
\begin{align*}
& Z_{0} H_{s}(r)=i k \operatorname{curl}\left(\mathcal{E}_{s} \widehat{z}\right)+\left(\operatorname{grad}(\operatorname{div}(.))+k^{2}\right)\left(\mathcal{H}_{s} \widehat{z}\right) \\
& =\frac{1}{8 \pi k^{2}}\left(\left[\underline{\mathcal{D}}_{e h}\left(r, r^{\prime}\right)\right] \cdot Z_{0} J_{r^{\prime}}+\left[\underline{\mathcal{F}}_{e h}\left(r, r^{\prime}\right)\right] \cdot M_{r^{\prime}}\right) \\
& =\frac{1}{8 \pi k^{2}}\left(Z_{0} J_{r^{\prime} \cdot}\left[\underline{\mathcal{D}}_{h e}\left(r^{\prime}, r\right)\right]+M_{r^{\prime}} \cdot\left[\underline{\mathcal{F}}_{e h}\left(r^{\prime}, r\right)\right]\right) \\
& =\frac{1}{8 \pi k^{2}}\left(Z_{0} J_{r^{\prime}} \cdot\left[\underline{\mathcal{D}}_{h e}\left(r^{\prime}, r\right)\right]+M_{r^{\prime}} \cdot\left[\frac{1}{i k} \operatorname{curl}_{r^{\prime}}\left(\left[\underline{\mathcal{D}}_{h e}\left(r^{\prime}, r\right)\right]\right)\right]\right. \tag{131}
\end{align*}
$$

where $\underline{\mathcal{F}}_{h e(, e h)}\left(r^{\prime}, r\right)$ and $\underline{\mathcal{D}}_{e h(, h e)}\left(r^{\prime}, r\right)$ are dyadic tensors. In these notations, we have $D \cdot[\widehat{a} \widehat{b}]=(D . \widehat{a}) \widehat{b},[\widehat{a} \widehat{b}] \cdot D=\widehat{a}(\widehat{b} \cdot D)$ and

$$
\begin{equation*}
\left[\underline{\mathcal{G}}\left(r, r^{\prime}\right)\right] \rightarrow\left[\underline{\mathcal{G}}\left(r^{\prime}, r\right)\right] \text { if }(x, y, z) \leftrightarrow\left(x^{\prime}, y^{\prime}, z^{\prime}\right) \text { and }(\widehat{x}, \widehat{y}, \widehat{z}) \leftrightarrow\left(\widehat{x}^{\prime}, \widehat{y}^{\prime}, \widehat{z}^{\prime}\right) \tag{132}
\end{equation*}
$$

The tensors verify the impedance boundary conditions,

$$
\begin{align*}
& \left.\widehat{z} \wedge\left[\left(\underline{\mathcal{D}}_{h e}+\underline{\mathcal{D}}_{h, i}\right)\left(r, r^{\prime}\right)\left(r, r^{\prime}\right)\right]\right|_{z=0}=-g^{e}\left(\left.\widehat{z} \wedge \widehat{z} \wedge\left[\left(\underline{\mathcal{F}}_{e h}+\underline{\mathcal{F}}_{e, i}\right)\left(r, r^{\prime}\right)\right]\right|_{z=0},\right. \\
& \left.\widehat{z} \wedge\left[\left(\underline{\mathcal{F}}_{h e}+\underline{\mathcal{F}}_{h, i}\right)\left(r, r^{\prime}\right)\right]\right|_{z=0}=\left.g^{e}\left(\widehat{z} \wedge \widehat{z} \wedge\left[\left(\underline{\mathcal{D}}_{e h}+\underline{\mathcal{D}}_{e, i}\right)\left(r, r^{\prime}\right)\right]\right)\right|_{z=0} . \tag{133}
\end{align*}
$$

and can be written,

$$
\begin{align*}
& \underline{\mathcal{F}}_{h e(, e h)} \equiv-\mathcal{B}\left(\underline{B}_{h(, e)}\right)+\mathcal{A}\left(\underline{A}_{e(, h)}\right) \\
& \underline{\mathcal{D}}_{h e(, e h)} \equiv \mathcal{B}\left(\underline{A}_{h(, e)}\right)+\mathcal{A}\left(\underline{B}_{e(, h)}\right) \tag{134}
\end{align*}
$$

where

$$
\begin{align*}
& {\left[\mathcal{A}\left(\underline{B}_{e(, h)}\right)\left(r, r^{\prime}\right)\right]=} \\
& =\left[i k\left(\widehat{x} \partial_{x}+\widehat{y} \partial_{y}+\widehat{z} \partial_{z}\right)\left(\widehat{y}^{\prime} \partial_{x}-\widehat{x}^{\prime} \partial_{y}\right)\left(\partial_{z} \mathcal{S}_{e(, h)}\left(r, r^{\prime}\right)\right)+\right. \\
& \left.+i k^{3} \widehat{z}\left(\widehat{y}^{\prime} \partial_{x}-\widehat{x}^{\prime} \partial_{y}\right)\left(\mathcal{S}_{e(, h)}\left(r, r^{\prime}\right)\right)\right] \tag{135}
\end{align*}
$$

$$
\begin{align*}
& \quad\left[\mathcal{B}\left(\underline{A_{e(, h)}}\right)\left(r, r^{\prime}\right)\right]= \\
& =\left[i k\left(\widehat{x} \partial_{y}-\widehat{y} \partial_{x}\right)\left(\widehat{x}^{\prime} \partial_{x}+\widehat{y}^{\prime} \partial_{y}+\widehat{z}^{\prime} \epsilon \partial_{z}\right)\left(\epsilon \partial_{z} \mathcal{S}_{e(, h)}\left(r, r^{\prime}\right)\right)+\right. \\
& \left.+i k^{3}\left(\widehat{x} \partial_{y}-\widehat{y} \partial_{x}\right) \widehat{z}^{\prime}\left(\mathcal{S}_{e(, h)}\left(r, r^{\prime}\right)\right)\right]  \tag{136}\\
& {\left[\mathcal{A}\left(\underline{A_{e(, h)}}\right)\left(r, r^{\prime}\right)\right]=} \\
& =\left[\left(\widehat{x} \partial_{x}+\widehat{y} \partial_{y}+\widehat{z} \partial_{z}\right)\left(\widehat{x}^{\prime} \partial_{x}+\widehat{y}^{\prime} \partial_{y}+\widehat{z}^{\prime} \epsilon \partial_{z}\right)\left(\epsilon \partial_{z^{2}} \mathcal{S}_{e(, h)}\left(r, r^{\prime}\right)\right)+\right. \\
& +k^{2} \widehat{z}\left(\widehat{x}^{\prime} \partial_{x}+\widehat{y}^{\prime} \partial_{y}+\widehat{z}^{\prime} \epsilon \partial_{z}\right)\left(\epsilon \partial_{z} \mathcal{S}_{e(, h)}\left(r, r^{\prime}\right)\right)+ \\
& +k^{2}\left(\widehat{x} \partial_{x}+\widehat{y} \partial_{y}+\widehat{z} \partial_{z}\right)\left(\widehat{z}^{\prime}\right)\left(\partial_{z} \mathcal{S}_{e(, h)}\left(r, r^{\prime}\right)\right)+ \\
& \left.+\widehat{z} \widehat{z}^{\prime} k^{4}\left(\mathcal{S}_{e(, h)}\left(r, r^{\prime}\right)\right)\right]  \tag{137}\\
& \quad\left[\mathcal{B}\left(\underline{B}_{e(, h)}\right)\left(r, r^{\prime}\right)\right]= \\
& \quad=\left[-k^{2}\left(-\widehat{x} \partial_{y}+\widehat{y} \partial_{x}\right)\left(\widehat{x}^{\prime} \partial_{y}-\widehat{y}^{\prime} \partial_{x}\right)\left(\mathcal{S}_{e(, h)}\left(r, r^{\prime}\right)\right)\right], \tag{138}
\end{align*}
$$

with $\epsilon=-1, \widehat{x}^{\prime} \equiv \widehat{x}, \widehat{y}^{\prime} \equiv \widehat{y}, \widehat{z}^{\prime} \equiv \widehat{z}$. The functions $\mathcal{S}_{e(, h)}$ verify the conditions [3],

$$
\begin{equation*}
\left.\left(\partial_{z}-i k g^{e(, h)}\right) \mathcal{S}_{e(, h)}\left(r, r^{\prime}\right)=\left(\partial_{z}+i k g^{e(, h)}\right) \mathcal{S}_{i}\left(r_{i m}, r^{\prime}\right)\right)\left.\right|_{z=0} \tag{139}
\end{equation*}
$$

where $g^{h}=1 / g^{e}, r_{i m}-r=2 \widehat{z} . r, \mathcal{S}_{i}\left(r, r_{i m}^{\prime}\right)=\mathcal{S}_{i}\left(r_{i m}, r^{\prime}\right)$, and

$$
\begin{align*}
& \mathcal{S}_{i}\left(r, r^{\prime}\right)=\left(e ^ { i k | \hat { z } . ( r - r ^ { \prime } ) | } E _ { 1 } \left(i k\left(\left|\left(r-r^{\prime}\right)\right|+\left|\widehat{z} .\left(r-r^{\prime}\right)\right|\right)+\right.\right. \\
& \left.+e^{-i k\left|\widehat{z} .\left(r-r^{\prime}\right)\right|}\left(E_{1}\left(i k\left(\left|\left(r-r^{\prime}\right)\right|-\left|\widehat{z} .\left(r-r^{\prime}\right)\right|\right)\right)+2 \ln \left|\widehat{z} \wedge\left(r-r^{\prime}\right)\right|\right)\right) \tag{140}
\end{align*}
$$

Their expressions are given by [3], [4],

$$
\begin{aligned}
& \mathcal{S}_{e}\left(r, r^{\prime}\right)=\left(\mathcal{S}_{i}\left(r_{i m}, r^{\prime}\right)+\sum_{\epsilon^{\prime}=-1,1} \frac{-2 g^{e}}{\left(g^{e}-\epsilon^{\prime}\right)}\left(\mathcal{V}_{\epsilon^{\prime}}+\epsilon^{\prime} \mathcal{K}_{g^{e}}\right)\right)\left(x-x^{\prime}, y-y^{\prime},-z-z^{\prime}\right), \\
& \mathcal{S}_{h}\left(r, r^{\prime}\right)=\left(-\mathcal{S}_{i}\left(r_{i m}, r^{\prime}\right)+\sum_{\epsilon^{\prime}=-1,1} \frac{2 g^{e}}{\left(g^{e}-\epsilon^{\prime}\right)}\left(\mathcal{V}_{\epsilon^{\prime}}+\epsilon^{\prime} \mathcal{K}_{g^{h}}\right)\right)\left(x-x^{\prime}, y-y^{\prime},-z-\mathcal{z}^{\prime}(1) 41\right),
\end{aligned}
$$

for $z \geq 0, z^{\prime} \geq 0$. The functions $\mathcal{V}_{\epsilon^{\prime}}$ and $\mathcal{K}_{g}$, which satisfy the Helmholtz equation above the plane, are given by

$$
\begin{align*}
& \mathcal{V}_{\epsilon^{\prime}}(x, y,-z)=e^{\epsilon^{\prime} i k z}\left(E_{1}\left(i k\left(|r|+\epsilon^{\prime} z\right)\right)+\left(1-\epsilon^{\prime}\right) \ln \rho\right) \\
& \mathcal{K}_{g}(x, y,-z)=e^{i k g z} \mathcal{J}_{g}(\rho,-z) \tag{142}
\end{align*}
$$

for $z \geq 0, \rho=\sqrt{x^{2}+y^{2}}, g=g^{e}$ or $g=g^{h}, g^{h}=1 / g^{e}$. Let us notice that we have

$$
\begin{align*}
\frac{\partial}{\partial z} \mathcal{S}_{i}(-z) & =i k\left(e^{i k z} E_{1}(i k(|r|+z))-e^{-i k z}\left(E_{1}(i k(|r|-z))+2 \ln \rho\right)\right) \\
\frac{\partial^{2}}{\partial z^{2}} \mathcal{S}_{i}(-z) & =-2 i k \frac{e^{-i k|r|}}{|r|}-k^{2} \mathcal{S}_{i}(-z) \tag{143}
\end{align*}
$$

and

$$
\begin{align*}
& \frac{\partial}{\partial z}\left(\mathcal{V}_{\epsilon^{\prime}}+\epsilon^{\prime} \mathcal{K}_{g}\right)(x, y,-z)=i k \epsilon^{\prime}\left(\mathcal{V}_{\epsilon^{\prime}}+g \mathcal{K}_{g}\right)(x, y,-z) \\
& \frac{\partial^{2}}{\partial z^{2}}\left(\mathcal{V}_{\epsilon^{\prime}}+\epsilon^{\prime} \mathcal{K}_{g}\right)=-i k \epsilon^{\prime}\left(\left(\epsilon^{\prime}-g\right) \frac{e^{-i k|r|}}{|r|}-i k\left(\epsilon^{\prime} \mathcal{V}_{\epsilon^{\prime}}+g^{2} \mathcal{K}_{g}\right)\right) \\
& \sum_{\epsilon^{\prime}=-1,1} \frac{-2 g^{e}}{\left(g^{e}-\epsilon^{\prime}\right)} \frac{\partial^{2}}{\partial z^{2}}\left(\mathcal{V}_{\epsilon^{\prime}}+\epsilon^{\prime} \mathcal{K}_{g^{e}}\right)=2 k^{2} \sum_{\epsilon^{\prime}=-1,1} \frac{g^{e}\left(\mathcal{V}_{\epsilon^{\prime}}+\epsilon^{\prime}\left(g^{e}\right)^{2} \mathcal{K}_{g^{e}}\right)}{\left(g^{e}-\epsilon^{\prime}\right)} \\
& \sum_{\epsilon^{\prime}=-1,1} \frac{2 g^{e}}{\left(g^{e}-\epsilon^{\prime}\right)} \frac{\partial^{2}}{\partial z^{2}}\left(\mathcal{V}_{\epsilon^{\prime}}+\epsilon^{\prime} \mathcal{K}_{g^{h}}\right)=-4 i k \frac{e^{-i k|r|}}{|r|}-2 k^{2} \sum_{\epsilon^{\prime}=-1,1} \frac{\left(g^{e} \mathcal{V}_{\epsilon^{\prime}}+\epsilon^{\prime} g^{h} \mathcal{K}_{g^{b}}\right)}{\left(g^{e}-\epsilon^{\prime}\right)}, 1 \tag{144}
\end{align*}
$$

for $z \geq 0$. The term $\ln \rho$ does not contribute to the field, except to suppress a singularity due to $E_{1}(i k(|r|-|z|))$ at $\rho=0$ [3]. From the behaviour of $\mathcal{J}_{g}, \mathcal{S}_{e(, h)}\left(r^{\prime}, r\right)$ remains definite for $g^{e}=1$ because $\mathcal{V}_{\epsilon^{\prime}=1}+\mathcal{K}_{g^{e}} \rightarrow 0$ when $g^{e} \rightarrow 1$, while it is singular for $g^{e}=-1$. Moreover, when $g^{h}=\left(g^{e}\right)^{-1} \rightarrow \infty$, we have $g^{h} \mathcal{K}_{g^{h}} \rightarrow-\frac{e^{-i k|r|}}{i k|r|}$. In a similar manner, the functions $\underline{\mathcal{F}}_{h, i(e, i)}$ and $\underline{\mathcal{D}}_{h, i(e, i)}$ can be also expressed like $\underline{\mathcal{F}}_{h e(, e h)}$ and $\underline{\mathcal{D}}_{h e(, e h)}$, if we take $\mathcal{S}_{i}\left(r, r^{\prime}\right)$ in place of $\mathcal{S}_{e(, h)}\left(r, r^{\prime}\right)$, and $\epsilon=1$.

## Remark 17 :

In a free domain $\Omega$ bounded by $S$, the field is the radiation of the surface sources [8],

$$
\begin{equation*}
M=-n \wedge E \delta_{S}, J=n \wedge H \delta_{S} \tag{145}
\end{equation*}
$$

with

$$
\begin{align*}
& Z_{0} \operatorname{div}(J)=Z_{0} \operatorname{div}\left(n \wedge H \delta_{S}\right)=-i k n \cdot E \delta_{S}-Z_{0}(n \wedge H) \cdot v \delta_{\partial S} \\
& \operatorname{div}(M)=-\operatorname{div}_{S}\left(n \wedge E \delta_{S}\right)=-i k Z_{0} n . H \delta_{S}+(n \wedge E) \cdot v \delta_{\partial S} \tag{146}
\end{align*}
$$

where $n$ is the normal to $S$ directed inside $\Omega, v$ is the geodesic normal to $\partial S$ directed outside $S$, and $\delta_{S}$ is the Dirac surface function.

## Remark 18 :

We notice that

$$
\begin{align*}
& \operatorname{curl}_{r}\left(\left[\underline{\mathcal{D}}_{h e(, e h)}\left(r, r^{\prime}\right)\right] \cdot C_{r^{\prime}}\right)=i k\left(\left[\underline{\mathcal{F}}_{e h(, h e)}\left(r, r^{\prime}\right)\right] \cdot C_{r^{\prime}}\right) \\
& \operatorname{curl}_{r}\left(\left[\underline{\mathcal{F}}_{h e(, e h)}\left(r, r^{\prime}\right)\right] \cdot C_{r^{\prime}}\right)=-i k\left(\left[\underline{\mathcal{D}}_{e h(, h e)}\left(r, r^{\prime}\right)\right] . C_{r^{\prime}}\right) \tag{147}
\end{align*}
$$

and

$$
\begin{align*}
& D_{r} \cdot\left[\underline{\mathcal{F}}_{h e(, e h)}\left(r, r^{\prime}\right)\right] \cdot C_{r^{\prime}}=C_{r^{\prime}} \cdot\left[\underline{\mathcal{F}}_{h e(, e h)}\left(r^{\prime}, r\right)\right] \cdot D_{r}, \\
& D_{r} \cdot\left[\underline{\mathcal{D}}_{h e(, e h)}\left(r, r^{\prime}\right)\right] \cdot C_{r^{\prime}}=C_{r^{\prime}} \cdot\left[\underline{\mathcal{D}}_{e h(, h e)}\left(r^{\prime}, r\right)\right] \cdot D_{r}, \tag{148}
\end{align*}
$$

with $C_{r^{\prime}}=c_{x} \widehat{x}^{\prime}+c_{y} \widehat{y}^{\prime}+c_{z} \widehat{z}^{\prime}, D_{r}=d_{x} \widehat{x}+d_{y} \widehat{y}+d_{z} \widehat{z}$ being two constant vectors.

## Remark 19 :

The tensors also satisfy,

$$
\begin{align*}
& {\left[\mathcal{A}\left(\underline{B}_{e, h}\right)\left(r, r^{\prime}\right)\right] \cdot C_{r^{\prime}}=} \\
& =i k\left(\operatorname{grad}(\operatorname{div}(\widehat{z} \cdot))+k^{2} \widehat{z} \cdot\right)\left(\left(C_{r^{\prime}}^{t} \wedge \widehat{z}\right) \operatorname{grad}\left(\mathcal{S}_{e, h}\left(r, r^{\prime}\right)\right)\right. \\
& =\left[i k\left(\widehat{x} \partial_{x}+\widehat{y} \partial_{y}\right)\left(\widehat{y}^{\prime} \partial_{x}-\widehat{x}^{\prime} \partial_{y}\right)\left(\partial_{z} \mathcal{S}_{e, h}\left(r, r^{\prime}\right)\right)+\right. \\
& \left.+i k \widehat{z}\left(\widehat{y}^{\prime} \partial_{x}-\widehat{x}^{\prime} \partial_{y}\right)\left(\partial_{z^{2}}+k^{2}\right) \mathcal{S}_{e, h}\left(r, r^{\prime}\right)\right] \cdot C_{r^{\prime}},  \tag{149}\\
& \quad\left[\mathcal{B}\left(\underline{A}_{e, h}\right)\left(r, r^{\prime}\right)\right] \cdot C_{r^{\prime}}= \\
& \quad=i k \operatorname{curl}\left(\widehat { z } \left(\epsilon \partial_{z}\left(C_{r^{\prime}}^{t} \operatorname{rad}\left(\mathcal{S}_{e, h}\left(r, r^{\prime}\right)\right)\right)+\right.\right. \\
& \left.\quad+c_{z}\left(\left(\partial_{z^{2}}+k^{2}\right) \mathcal{S}_{e, h}\left(r^{\prime}, r\right)\right)\right) \\
& \quad=\left[i k \left(\left(\widehat{x} \partial_{y}-\widehat{y} \partial_{x}\right)\left(\widehat{x}^{\prime} \partial_{x}+\widehat{y}^{\prime} \partial_{y}\right) \epsilon \partial_{z} \mathcal{S}_{e, h}\left(r, r^{\prime}\right)+\right.\right. \\
& \left.\left.\quad+\left(\widehat{x} \partial_{y}-\widehat{y} \partial_{x}\right) \widehat{z}^{\prime}\left(\partial_{z^{2}}+k^{2}\right) \mathcal{S}_{e, h}\left(r, r^{\prime}\right)\right)\right] \cdot C_{r^{\prime}},  \tag{150}\\
& {\left[\mathcal{A}\left(\underline{A}_{e, h}\right)\left(r, r^{\prime}\right)\right] \cdot C_{r^{\prime}}=} \\
& =\left(\operatorname{grad}(\operatorname{div}(\widehat{z} \cdot))+k^{2} \widehat{z} \cdot\right)\left(C_{r^{\prime}}^{t}\left(\epsilon \partial_{z} \operatorname{grad}\left(\mathcal{S}_{e, h}^{\epsilon}\left(r, r^{\prime}\right)\right)\right)+\right. \\
& \left.+c_{z}\left(\left(\partial_{z^{2}}+k^{2}\right) \mathcal{S}_{e, h}\left(r, r^{\prime}\right)\right)\right) \\
& =\left[\epsilon \epsilon \partial_{z^{2}}\left(\widehat{x} \partial_{x}+\widehat{y} \partial_{y}\right)\left(\widehat{x}^{\prime} \partial_{x}+\widehat{y}^{\prime} \partial_{y}\right) \mathcal{S}_{e, h}\left(r, r^{\prime}\right)+\right. \\
& +\partial_{z}\left(\widehat{x} \partial_{x}+\widehat{y} \partial_{y}\right)\left(\widehat{z}^{\prime}\right)\left(\partial_{z^{2}}+k^{2}\right) \mathcal{S}_{e, h}\left(r, r^{\prime}\right)+ \\
& +\widehat{z}\left(\widehat{x}^{\prime} \partial_{x}+\widehat{y}^{\prime} \partial_{y}\right)\left(\partial_{z^{2}}+k^{2}\right)\left(\epsilon \partial_{z} \mathcal{S}_{e, h}\left(r, r^{\prime}\right)\right)+ \\
& \left.+\widehat{z} \widehat{z}^{\prime}\left(\partial_{z^{2}}+k^{2}\right)\left(\partial_{z^{2}}+k^{2}\right) \mathcal{S}_{e, h}\left(r, r^{\prime}\right)\right] \cdot C_{r^{\prime}},  \tag{151}\\
& \\
& {\left[\mathcal{B}\left(\underline{B}_{e, h}\right)\left(r, r^{\prime}\right)\right] \cdot C_{r^{\prime}}=} \\
& =i k \operatorname{curl}\left(\widehat{z}\left(i k\left(C_{r^{\prime}}^{t} \wedge \widehat{z}\right) \operatorname{grad}\left(\mathcal{S}_{e, h}\left(r, r^{\prime}\right)\right)\right)\right)  \tag{152}\\
& =\left[-k^{2}\left(-\widehat{x} \partial_{y}+\widehat{y} \partial_{x}\right)\left(\widehat{x}^{\prime} \partial_{y}-\widehat{y}^{\prime} \partial_{x}\right)\left(\mathcal{S}_{e, h}\left(r, r^{\prime}\right)\right)\right] \cdot C_{r^{\prime}},
\end{align*}
$$

where $C_{r^{\prime}}=C_{r^{\prime}}^{t}+c_{z} \widehat{z}^{\prime}$, and, from the Helmholtz equation satisfied by $\mathcal{S}_{e, h}$,

$$
\begin{align*}
& {\left[\mathcal{B}\left(\underline{B}_{e, h}\right)\left(r, r^{\prime}\right)\right] \cdot C_{r^{\prime}}=} \\
& =-k^{2}\left(\left(c_{x} \partial_{x}+c_{y} \partial_{y}\right)\left(\widehat{x} \partial_{x}+\widehat{y} \partial_{y}\right)+\right. \\
& \left.+\left(c_{x} \widehat{x}+c_{y} \widehat{y}\right)\left(\partial_{z^{2}}+k^{2}\right)\right)\left(\mathcal{S}_{e, h}\left(r, r^{\prime}\right)\right) . \tag{153}
\end{align*}
$$
